

THREADLINE V14.2

ACQUISITION REVERSE-ENGINEERING CONTROL LOOP

DRAFT - BRANDING PENDING | course-authority operating patch

What changed

No offer, pricing, niche, product or delivery decision changed. V14.2 hardens the existing course-derived reverse-engineering principle into the daily acquisition operating system.

Canonical equation

required first touches = target wins / (booking rate x show rate x qualification rate x close rate)

required first touches per day = required first touches / remaining acquisition workdays

Round the daily requirement UP. Rates are decimals (2% = 0.02).

Illustrative example only

Target wins	Booking	Show	Qualified	Close	Days	Touches/day
2	2%	75%	75%	15%	60	~20

These percentages are NOT Threadline benchmarks. They only demonstrate the chain. Use conservative labelled assumptions until real Threadline data exists.

Friday control loop

1. Freeze the week's raw counts before changing anything.
2. Recalculate booking, show, qualification and close rates.
3. Recalculate remaining first touches and next week's daily quota.
4. Find the first weak conversion: reach -> reply -> positive -> booking -> show -> qualified -> offer -> close -> cash.
5. Change ONE meaningful variable aimed at that bottleneck.
6. Preserve the previous message/channel/version so comparisons stay legible.
7. Keep cold outbound, warm/referral and inbound economics separate when volume permits.

Operating guardrails

- Do not borrow another creator's close/booking rates as if Threadline owns them.
- Do not lower the quota because outreach feels uncomfortable.
- Do not count C-fit prospects merely to hit volume.
- Do not change niche + offer + message + channel simultaneously.
- If the required quota becomes absurdly high, diagnose the economics/funnel rather than blindly brute-forcing volume.
- Optional building/content comes only after required revenue actions.

North-star question

Did we hit the mathematically required qualified input today, and what does the funnel now tell us?

THREADLINE V14 - COURSE-AUTHORITY PRODUCTIZATION + VALIDATION AD- DENDUM

DRAFT - BRANDING PENDING | 4 September 2026

Why V14 exists

V13 established the course archive as methodology authority. V14 integrates the mentor productization transcript **without allowing it to override the course or previously locked Threadline decisions.**

Authority hierarchy

1. Founder-locked Threadline decisions remain fixed until explicitly reopened.
2. Reviewed course principles govern operating methodology.
3. Real Threadline prospect/client/funnel/load evidence updates implementation.
4. Mentor transcript is secondary evidence/implementation guidance only.
5. Official technical/legal/platform facts govern their own domains.
6. Other inspiration and assistant preference are subordinate.

What changes now

The main change is sequencing:

**ONE WEDGE -> IMMERSION -> DIRECT PROBLEM/SOLUTION
VALIDATION -> FREEZE ONE EXPENSIVE PROBLEM +
QUALIFICATION + OUTCOME -> FINISH LAUNCH GATE ->
REVERSE-ENGINEER ACQUISITION -> SELL THE DEFINED
SYSTEM -> CLIENT #1 OVERDELIVERY + ATOMIC DOCU-
MENTATION -> IMPROVE THE REUSABLE 80% -> PROOF ->
SCALE.**

Threadline no longer treats the umbrella phrase **expert-led B2B** as enough niche definition for scaled launch.

Productization doctrine

Threadline should feel tailored but operate as a productized service: - target roughly **80% standard process / 20% configured context**; - the standard 80% is the Threadline evidence -> strategy -> creation -> recording -> production -> distribution -> learning loop; - the 20% is the client's market, offer, voice, proof, stories, visual brand, claims, CTA and current constraint; - do not

let each prospect design a new service; - out-of-scope requests become evidence, not automatic scope.

Outcome hierarchy - unchanged, now made stricter

1. **Commercial outcome:** authority + qualified demand/pipeline.
2. **Creative output:** high-quality content people actually want to watch.
3. **Operational benefit:** less founder coordination burden.

Threadline is a **marketing** service. Workflow optimisation is not the headline result.

Validation gate

Course niche immersion + Problem/Solution Validation govern. V14 uses the mentor's first-sample heuristic: - run 5 research conversations; - look for the same underlying expensive pain to appear independently; - 4/5 is a useful signal, not a forced scientific rule; - if the signal is mixed, interview more or change the hypothesis; - do not respond to uncertainty by building more software.

Sales posture

Specialisation should let Threadline increasingly **arrive knowing**, but never fake certainty. Sales verifies which validated pattern is present, diagnoses severity, then prescribes the existing Threadline system if fit.

Do **not** ask: What content package would you like us to build?

Do: In businesses like yours we repeatedly see X/Y/Z. I want to understand which is actually constraining you and whether our existing system fits.

Offer decisions that remain locked

- GBP 2,500 implementation + GBP 2,500/month;
- 3-month initial engagement;
- one offer at launch;
- no three pricing tiers yet;
- YouTube long-form PILOT/CUSTOM;
- DFY managed content-growth service, not SaaS access;
- manual/native delegated publishing valid Phase 0;
- no revenue/virality guarantees.

The mentor's tier recommendation is **deferred**. It is only revisited if repeated demand reveals predictable next outcomes/add-ons.

Client #1 doctrine

Client #1 is the productized-service prototype. Overdeliver on the promised problem/outcome, not on random scope. Record every dependency, handoff, wait state, QA step and minute. After each cycle improve the reusable 80%.

Current next action

Send Claude the consolidated V14 master prompt. In parallel execute SOP 00 V14. Product work is frozen except launch/security/deployment blockers.

THREADLINE COURSE-AUTHORITY AUDIT V1

Status: Internal operating document. DRAFT - BRANDING PENDING.

Date: 4 September 2026

1. Authority hierarchy

For Threadline operating decisions, use this order:

1. **Explicit founder-locked decisions** already agreed for Threadline (e.g. the founding commercial offer, Threadline as a managed content-growth service, one codebase/two experiences, honest integrations, personal-brand front door, long-form YouTube as PILOT/CUSTOM).
2. **Imperium / Charlie Morgan source principles** from the course corpus that has actually been reviewed in the source audit.
3. **Real Threadline evidence** from market immersion, outreach, sales calls, client delivery, proof and load data.
4. Current official platform/legal/technical documentation where facts depend on external systems.
5. Other operator/competitor inspiration.
6. Speculation, aesthetics and preference.

The course is the primary *operating-method authority*, but it does not silently overwrite explicit commercial decisions already locked by the founder. Nor do we copy deceptive, spammy, outdated or legally questionable tactics. We preserve the underlying principle and adapt the execution honestly.

2. What source material is actually authoritative

The prior source-coverage audit recorded the written corpus as reviewed across niche viability/immersion, problem definition, offer architecture, minimum viable methodology, sales bedrock/conversion, script iteration, outbound/inbound, ideation, creation, storing, packaging, distribution, filming, onboarding, reporting/retention, proof, systems, SOPs, hiring/decentralisation and finance. Remaining Q&A/livestream/tutorial pages without transcript remain **not consumed as lesson content**.

Named course resources represented in the archive/index include, among others: Grade A Niche Selection, Total Niche Immersion, Immersion Strategy, Problem & Solution Validation, Outstanding Offer Architect, 90 Day Plan Of Attack, Reverse Engineering Your Goal, Distribution System, Managing Finances & Cashflow, VA Masterclass, Imperium Approach, Building Outbound, Building Inbound, Daily Metric Tracking SOP, lead sourcing, Loom recording/sending systems, Sales Bedrock / Conversion Playbook material and content creation/filming resources.

3. Audit result in one sentence

Threadline’s offer, delivery architecture and sales logic are already strongly course-aligned; the biggest V12 drift was acquisition becoming too opinion-led (“LinkedIn first”) instead of being reverse-engineered from the goal, niche access and funnel math, plus content volume being allowed to outrun idea/packaging quality.

4. Whole-business authority matrix

Area	Course principle	V12 state	V13 decision
Niche	Pick a viable market, immerse deeply, validate problem/solution	Broad expert-led B2B wedge	Keep category, but require one active niche hypothesis + immersion gate before scaling outreach
Problem	Define who/what/where/when/why before how	Strong	Retain; diagnosis remains hypothesis not fake science
Offer	Strong outcome, simple offer, remove risk, avoid needless tiers	Strong	Retain agreed £2.5k setup + £2.5k/mo, 3 months, one offer
Methodology	Minimum viable methodology; simplest sequence that causes result	Strong but product can tempt complexity	Explicitly cut non-essential delivery and product steps from client #1 path
Acquisition planning	Reverse-engineer target into calls/bookings/outreach measure daily	V12 used fixed 15-20/day and LinkedIn lock	Replace with funnel-math target; starting assumptions only until real data
Acquisition architecture	System = scheduler/platform/stimulus/CRM/lead source/metrics/delivery	Strong	Keep, make each component explicit and auditable

Area	Course principle	V12 state	V13 decision
Outbound channel	Choose controllable channel that reaches niche; build repeatable motion	LinkedIn declared primary	Remove ideological LinkedIn lock; V13 launch hypothesis = cold email delivery + LinkedIn research/trust support, then data decides
Personalisation	High effort only where economics justify it	Strong	Keep Loom/diagnosis for A-fit only
Inbound	Build a deliberate content system, not random posting	Strong concept, cadence opinionated	Keep content engine, remove quota worship; content must support buyer education/trust
Sales	Diagnose current -> desired -> gap -> bridge; ask, do not feature-dump	Strong	Retain
Sales iteration	Version script; enough calls before emotional rewrites; learn VOC	Present	Strengthen: no wholesale sales-script reset before ~30 qualified calls unless a fatal issue is obvious
Onboarding	Immediate after payment, clear first steps	Strong	Retain
First-month trust	Fast visible win	Strong Day-7	Retain and make it non-negotiable
Delivery	Standardise one core fulfilment machine	Strong	Retain; no custom-service sprawl
Reporting	Action -> Results -> Problems -> Future	Strong	Retain as mandatory monthly structure

Area	Course principle	V12 state	V13 decision
Retention	Detect dissatisfaction before renewal point	Strong	Retain
Content creation	Golden idea -> points -> environment -> hook -> points -> outro -> feedback	72-script batching could overemphasise volume	Add Golden-Idea Gate and package/visual mechanism before recording
Recording	Quiet/controlled environment, light/audio, test, repeatability	Strong	Retain Recording Readiness Install
Packaging	Packaging is part of the content system, not an afterthought	Strong for YouTube; lighter for shorts	Require hook + visual device + package before record for every priority asset
Distribution	Distribution is a system with deliberate platform fit	Strong	Retain; no automatic everywhere-posting
Metrics	Track leading + lagging metrics daily/weekly	Strong	Expand acquisition math + delivery economics
Proof	Baseline, preserve evidence, build case studies from defensible causality	Strong	Retain
Systems thinking	Input -> process -> output -> feedback -> environment; find bottleneck	Strong	Make bottleneck review the weekly management layer across acquisition and delivery
SOPs	Document proven repeatable work, not imagined workflows	Strong	Retain; SOP 10 remains gatekeeper

Area	Course principle	V12 state	V13 decision
Hiring	Prove role/process first; ramp before independence	Strong	Retain
Delegation	Remove low-value founder work only after system is understood	Strong	Retain
Finance	Know cashflow, margin, capacity and economics	Underbuilt	Add weekly finance/operator scoreboard from first revenue
Scale	Scale what works after proof; avoid premature breadth	Strong	Retain More -> Better -> New as Threadline shorthand
Tech	System exists to make fulfilment easier, not to look impressive	Strong	Retain freeze; no speculative modules
Integrations	Build when repeated bottle-neck/economics justify it	Strong	Retain SOP 11

5. The V13 niche and immersion gate

Before Threadline treats an ICP/channel as “locked”, complete one focused immersion sprint for the active niche hypothesis.

Output required: - 25-50 companies reviewed; - 20+ founder/content examples; - 20+ buyer/customer language snippets from credible public/customer sources; - top pains, desired states, objections, buying triggers and current alternatives; - what they already buy and rough economics; - how they currently produce content; - where decision-makers are reliably reachable; - 10 offer/message hypotheses; - 10 content angles using their language; - 10 outreach observations; - disqualifiers and maturity-stage notes.

Then choose one active niche hypothesis for the next sample. Do not bounce niches based on mood.

6. Acquisition: the key V13 correction

Do not start with “LinkedIn because LinkedIn”

The course logic is system-first and reverse-engineered. Platform is one component, not the strategy.

Launch hypothesis

For the first controlled outbound experiment: - **primary delivery mechanism**: cold email to qualified business prospects; - **LinkedIn**: sourcing, context, credibility, light warm touch and follow-up where appropriate; - **A-fit only**: short personalised Loom/diagnosis; - **warm/referral**: tracked separately; - **own content**: inbound/trust layer, not a substitute for outbound reps.

If the niche immersion shows another channel is materially easier to reach or converts better, change the platform while keeping the system intact.

Reverse-engineer the daily number

Use:

$$\text{required first touches} = \frac{\text{target wins}}{(\text{booking rate} \times \text{show rate} \times \text{qualified rate} \times \text{close rate})}$$

Then divide by remaining acquisition workdays.

With no Threadline data, use *temporary planning assumptions* only. Example: 2 wins, 2% booking, 75% show, 75% qualified, 15% close -> about 1,185 qualified first touches over 60 working days -> about 20/day. Replace assumptions with actuals every Friday.

The rule is therefore **not “15 LinkedIn DMs/day”**. The rule is **hit the mathematically required number of qualified first touches through the current controlled acquisition system**.

7. Sales authority

Threadline keeps the current diagnosis call because it matches the course’s core sales logic:

current state -> desired state -> gap/problem -> consequence -> bridge/method -> offer -> decision.

Mandatory V13 rules: - pre-call research; - diagnose before prescribe; - use prospect language; - show only the relevant closed loop; - one explicit next state after every call; - log exact objections/questions; - version the script; - avoid wholesale emotional rewrites before roughly 30 qualified calls unless a fatal flaw is unmistakable; - change one meaningful variable at a time.

8. Offer authority

Do **not** remove or replace the agreed founding offer.

Locked hypothesis: £2,500 implementation + £2,500/month, 3-month initial engagement, one offer.

Course alignment: - rich enough market; - one valuable customer can justify fee; - one simple methodology; - controllable risk reversal, not revenue guarantee; - fast visible implementation win; - no Bronze/Silver/Gold before proof; - narrow scope to what produces the promised effect.

9. Content authority

The 72-script advantage is real, but the course implies **quality gates before volume**.

Every priority content asset must pass: 1. **Golden idea:** a commercially relevant, specific idea worth saying. 2. **Points:** 2-5 supporting points / story beats. 3. **Package:** hook + visual mechanism + format + title/thumbnail where relevant. 4. **Recording environment:** setup matched to format. 5. **Record:** natural delivery, multiple takes if needed. 6. **Feedback:** performance + qualitative buyer response. 7. **Iteration:** more of proven themes, better package, then new format.

The 72-bank remains, but it is an **inventory**, not an obligation to publish 72 untouched scripts.

10. Delivery authority

Threadline's client delivery remains:

Context -> Evidence -> Diagnosis -> Strategy -> Ideas/Scripts -> Record -> Produce/QA -> Approve -> Distribute -> Measure -> Learn.

The course-derived constraint is to keep this the **minimum viable methodology**. If a step does not improve quality, demand, client trust, learning or repeatability, remove it. Software is infrastructure, not a reason to add ceremony.

11. Founder role

At launch, the founder's highest-value jobs are:

1. **Market judgement:** niche immersion, signal approval, positioning and offer decisions.
2. **Acquisition/sales:** outbound, Looms for A-fit, diagnosis calls, follow-up, closing.

3. **Creative judgement:** approve the best ideas/scripts/angles and record Threadline's own content.
4. **Client strategy/QA:** onboarding interview, strategic decisions, high-level QA and retention conversations.

Everything else is either software-assisted, editor-owned, templated, delegated later or deleted.

12. Finance and capacity authority

From the first paying client, weekly track: - cash collected; - MRR; - setup revenue; - direct fulfilment cost; - editor/vendor cost; - founder hours by acquisition vs delivery; - gross contribution/client; - acquisition cost/hours; - delivery hours/client; - cash runway / committed obligations where relevant; - capacity before next sale.

Do not scale a funnel that creates an unprofitable fulfilment job.

13. Current execution sequence - course aligned

1. Finish Claude launch hardening only; no new speculative product work.
2. Complete **Market Immersion / Niche Gate** and select one active niche hypothesis.
3. Freeze the already-agreed offer scope and risk reversal.
4. Ensure booking, CRM, proposal/SOW/payment and editor bench work.
5. Reverse-engineer the 90-day funnel and set the current daily first-touch requirement.
6. Build the first 100+ prospects from the chosen niche.
7. Launch the controlled outbound motion; start with cold email + LinkedIn support + selective A-fit Looms.
8. Run diagnosis calls; log VOC and metrics.
9. Do not rebuild the offer, sales script or niche after a tiny sample.
10. Close client #1; run Day-7 win; measure delivery load and proof.
11. Scale only after the bottleneck and economics are visible.

14. What V13 explicitly rejects

- Channel choice based on fashion or preference.
- Content volume as a substitute for a golden idea and strong package.
- Rebuilding the offer after a handful of uncomfortable responses.
- Building a second acquisition machine before the first has enough data.
- Hiring before the process is personally understood and measured.
- Custom fulfilment for every client.
- Fake scarcity, fake identities, deceptive research or spam tactics.
- Treating video-only course wrappers as if their lesson content was reviewed.

15. Final operating doctrine

Immerse before guessing. Reverse-engineer before doing volume. Diagnose before prescribing. Run one simple offer and one minimum viable methodology. Track the funnel. Version the script. Get enough reps. Give clients a fast visible win. Measure proof and load. SOP only proven work. Hire only after the process is understood. Scale what converts.

THREADLINE

V12 STRATEGIC CORRECTION

Personal-brand front door + Threadline operating mechanism + founder content engine. This section supersedes older positioning/cadence where they conflict.

1. The sharper commercial hierarchy

Immediate creative promise

You already have the expertise. We turn it into content people actually want to watch.

Deeper operating promise

We run the system around it so that content compounds into authority and qualified demand.

Full Threadline promise

Threadline turns expert knowledge into high-quality content that builds authority and qualified demand - without making the founder run the content machine.

What this corrects

- Threadline is not merely a workflow consultancy. Better content is a direct output of the service.
- The operating system is the mechanism that makes quality repeatable, reduces founder effort and creates a learning loop.
- Qualified demand is the business outcome. It should not replace the more emotionally immediate desire for a stronger personal brand and better content in the front-door message.

2. The problem we actually solve

- The founder has valuable expertise but does not consistently convert it into compelling media.
- They may not know what to say, how to package it, how to create strong hooks, how to look/sound good on camera, or how to turn expertise into recurring formats.
- They may simply not want content to become another full-time job.
- Existing teams/agencies often become editing factories: they ship assets but do not systematically improve the message, creative quality or commercial learning.
- The result is inconsistent output, generic content, founder frustration, wasted expertise and weak translation from attention into trust or pipeline.

The Threadline diagnosis

The client does **not** have to become a creator-operator. The founder is the scarce source of expertise and credibility. Threadline should make the surrounding work disappear: evidence, angles, scripts, recording preparation, production, packaging, distribution, learning and iteration.

3. Front door vs deeper differentiation

Front door	Build a personal brand / make content people want to watch.	Immediate, emotionally legible desire.
Objection destroyer	You do not need crazy time, money, gear or a huge team.	Pre-empts the most common cope and increases perceived attainability.
Mechanism	Extract expertise, use market evidence, script/package well, run a repeatable production + learning loop.	Explains why Threadline is different from a generic coach/editor.
Commercial end state	Authority + qualified demand with lower founder coordination burden.	Makes the spend economically rational.

Content positioning rule

Do not become a generic personal-brand coach. Use personal-brand improvement as the front door, then repeatedly reveal the Threadline thesis underneath: good content is not random creativity; it comes from better inputs, better extraction, better packaging and a system that learns.

4. Founder-content mix

50%	Make better founder/personal-brand content	Hooks, ideas, stories, positioning, delivery, visual hooks, teardowns, anti-boring content, anti-AI-slop.
30%	You are making content harder than it needs to be	No 20hr weeks, no giant team, no £5k camera, no daily brainstorming, no founder project-management.
20%	Commercial content / demand	Why views are not the goal, qualified audience, content-to-pipeline, authority, sales signals, learning loops.

Editorial tone

- Polarise at the diagnosis, not through empty ragebait.
- Attack weak methods, bad assumptions and generic content - not individual founders for sport.
- Make the viewer think: “That is exactly what I am doing” or “I thought I needed that, but I do not.”
- Every third-to-fifth piece should make Threadline’s mechanism visible without turning into an ad.

5. 72-script batch system

Because recording capacity is unusually high, Threadline should exploit batching. The bottleneck is not camera stamina; it is idea quality, script quality, visual packaging, editing and learning.

1	Build 72-script bank	18 per pillar across 4 pillars, or 36/22/14 by 50/30/20 mix.
2	Tag every script	Pillar, buyer pain, awareness stage, hook type, visual device, CTA, expected format.
3	Batch production prep	Group by location, outfit, prop, camera angle and required B-roll.
4	Record in blocks	Use 12-18 script blocks with short reset windows; mark weak takes immediately.
5	Do not publish blindly	Release first 10-15; inspect retention, saves, qualified comments, DMs and profile actions.
6	Re-rank backlog	Keep strong evergreen scripts; rewrite weak hooks; kill duplicates; create variants of outliers.
7	More -> Better -> New	First increase reps, then improve proven themes, only then add new formats/channels.

6. Content idea bank - 72 launch ideas

1	Your personal brand is boring because you sound like everyone else.
2	Stop making "5 tips" content like this.
3	You do not need to post three times a day.
4	You probably already have a year of content inside your expertise.
5	The easiest way to find 30 content ideas in 20 minutes.
6	Why your best content ideas are hiding inside client questions.
7	Your content does not need more information - it needs a point of view.
8	The difference between teaching and being memorable.
9	Why smart founders sound stupid on social media.
10	If your script could be posted by anyone, delete it.
11	Why your expertise is being flattened into generic LinkedIn sludge.
12	The three kinds of proof every expert should turn into content.
13	Turn one client objection into five strong posts.
14	How to turn a boring case study into a story people watch.
15	Why "educational content" is often a trap.
16	Your hook is not the first sentence - it is the first reason to care.
17	The fastest way to sound less scripted on camera.
18	Why over-explaining kills authority.

19	What I would change about this founder's video in 60 seconds.
20	A viral founder post can still be a terrible business asset.
21	The content audit I would run before writing another post.
22	Why copying top creators usually makes your content worse.
23	How to create a repeatable series people recognise.
24	The personal-brand moat nobody talks about: accumulated specificity.
25	You do not need 20 hours a week to build a personal brand.
26	You do not need a £5,000 camera to look credible.
27	You do not need a five-person content team.
28	Your founder should not be brainstorming every post from scratch.
29	If you are chasing editors in Slack, your content system is broken.
30	The founder should not be the project manager of their own content team.
31	The best content workflow starts before the camera turns on.
32	Why content consistency is usually an operations problem, not discipline.
33	Batching 50 videos is easier than making one every day.
34	The reason your content process feels exhausting.
35	You are probably spending founder time on £20/hour tasks.
36	How I would build a month of content from one 90-minute expert interview.

37	Your recording day should be boring - that is a good thing.
38	The anti-content-calendar content system.
39	Why daily idea generation is a terrible operating model.
40	A strong personal brand can be built with one real recording block per week.
41	The four things a founder should still personally own.
42	Everything I would remove from a founder's content workload.
43	Why more software does not fix a broken content process.
44	The "I do not have time for content" objection is usually solvable.
45	You do not need to become an influencer to win from content.
46	A personal brand should fit around the business, not consume it.
47	The hidden cost of making content ad hoc.
48	Why a content team without a learning loop gets dumber over time.
49	Views are not the same thing as demand.
50	The 10,000-view post I would prefer over a 500,000-view post.
51	How content creates trust before a sales call.
52	The metric I care about more than follower count for a £10k service.
53	Why a small audience can be economically huge.
54	Content should make sales conversations easier, not just increase reach.

55	The signal that tells me a topic is commercially useful.
56	Why most B2B content attribution is fake precision.
57	How to use sales objections as your content roadmap.
58	A good post should teach you something about your market.
59	The feedback loop most content agencies forget.
60	How one strong piece becomes a message test, not just a post.
61	Why your content team should know what prospects say on sales calls.
62	How to turn audience response into the next 10 scripts.
63	The difference between audience attention and buyer attention.
64	Why qualified comments beat vanity engagement.
65	What I would track from content if I ran a high-ticket service.
66	Content that builds authority vs content that just gets reach.
67	Why "go viral" is a terrible business brief.
68	The content-to-pipeline chain in one diagram.
69	The three commercial jobs founder content can do.
70	If your content cannot influence trust, sales or learning, what is it for?
71	How to know whether a content theme deserves another 20 posts.
72	Why the next post should be informed by the last 20.

7. Operational implication

This positioning change does not justify another product rebuild. It changes marketing copy, content strategy and how the offer is explained. The service architecture remains: evidence -> strategy -> ideas -> scripts -> record -> edit/package -> publish -> performance/commercial signals -> learning.

- Update public-facing copy to lead with better content/personal brand and preserve qualified-demand language underneath.
- Use the founder-content bank as an acquisition trust layer after the daily revenue floor.
- Do not add a “content coach” product, course, community or new SaaS module.
- Use real prospect/client language to refine the front-door promise after 10-20 conversations.

THREADLINE

Master Blueprint V11

Launch Focus + Execution Lock

Current decision layer - 4 September 2026

ONE OFFER	ONE ICP HYPOTHESIS	ONE PRIMARY CHANNEL
Founding offer stays stable until buyer evidence earns a change.	High-LTV expert-led B2B; use calls to sharpen the first wedge.	LinkedIn outbound first. Email supports the same accounts.

Operating principle: MORE -> BETTER -> NEW

Run enough real repetitions. Improve the current system from evidence. Add channels, features or staff only after the existing system earns the decision.

This V11 front section supersedes any conflicting acquisition/channel guidance in the inherited V9 pages that follow. The V9 research, offer, delivery, client-experience and integration work remains part of the master blueprint unless explicitly overridden here.

1. What changed since V9/V10

The underlying Threadline strategy did not break. The useful correction is about **focus**: the inherited blueprint displayed too many simultaneous acquisition activities for a pre-revenue company. V11 narrows launch execution without undoing the deeper delivery/product work.

Inherited guidance	V11 launch decision
LinkedIn + email as co-primary	LinkedIn outbound is primary. Email is only a supporting touch to the same target accounts.
Heavy LinkedIn + X + YouTube cadence	Own LinkedIn content is the trust layer after revenue actions. X and Threadline YouTube are not launch priorities.
Potentially add channels as activity grows	Use More -> Better -> New. Earn a new channel with evidence.
Track activity/conversions	Also track show rate, close rate, cash, acquisition hours/cost and practical CAC after wins.
Hire when scale feels large	Use measured Delivery Load data. Ramp hires before independent client ownership.

What did *not* change

Threadline is still a managed content-growth service, not SaaS access. The founding price hypothesis, Day-7 installation, diagnosis/intelligence loop, recording readiness, curated client portal, proof capture, manual/native publishing fallback and evidence-led integration gate remain intact.

2. Launch acquisition system - locked

Primary channel	LinkedIn outbound for the initial learning window. The target is qualified conversations, not vanity activity.
Supporting channel	Email may support the same target accounts. Do not build a separate cold-email machine before LinkedIn has been properly tested.
Trust layer	Up to four useful LinkedIn posts/week after revenue actions. Use buyer problems, diagnoses, mechanisms, teardowns and real learning.
Not launch priorities	X, Threadline YouTube, paid acquisition, partnership programmes and new acquisition software.
Daily floor	15-20 qualified first touches normally; hard floor 10. Follow-ups 20-30/day once the queue exists.
Learning loop	Prospect -> reply -> positive reply -> booked -> show -> qualified -> offer -> win -> cash. Diagnose the first broken conversion.

Change control

MORE: confirm the sample is meaningful. **BETTER:** change one meaningful variable in targeting, observation, message, CTA, follow-up or sales execution. **NEW:** add/switch a primary channel only when the current system has earned that decision or a hard constraint makes it necessary.

Do not simultaneously change niche + offer + outreach + channel. That destroys the feedback loop.

3. Economics, paid acquisition and scale

Threadline should know its funnel before it tries to buy volume.

Metric	Why it matters
Show rate	Separates booking quality/reminders from sales skill.
Qualified-call rate	Tests targeting and ICP.
Offer rate	Tests diagnosis/fit discipline.
Close rate	Tests offer, proof, trust, price and sales execution.
Cash collected	Reality, not pipeline theatre.
Acquisition hours + direct costs	Makes founder effort and tools visible.
Practical CAC	Direct acquisition costs plus a sensible internal cost for founder acquisition time, divided by wins.
Delivery load/client	Determines whether more demand is actually desirable.

Paid acquisition gate

Do not use paid ads because outbound feels uncomfortable. Consider paid acquisition only after Threadline has usable show/close data, client economics/retention evidence and fulfilment capacity to absorb additional demand.

Operator/hiring gate

Use measured Delivery Load data rather than an arbitrary revenue milestone. Delegate repeatable lower-value operational work before strategic judgement. Ramp: **test task -> sandbox -> shadow -> supervised real work -> QA pass -> independent ownership.**

4. Current execution - Friday 4 September

Current state: **STAGE 0 - LAUNCH**. The product is not the bottleneck. Finish the gate and expose the offer to the market.

1

Send Claude V11

Run the current launch-hardening prompt. Do not let Claude invent acquisition/product features outside scope.

2

Lock commercial path

Founding scope, price, 3-month term, exclusions, controllable risk reversal, proposal/SOW/agreement/payment.

3

Finish operating prerequisites

Booking page + reminders; primary and backup editor; rates/capacity/turnaround.

4

Seed market

First 100 qualified prospects in CRM, prioritised A/B fit.

5

QA + deploy

Browser QA at 1440/1024/768/390, client-role security, build/tests, production/Postgres, secrets and smoke test.

6

Go external

When Launch Gate is green, open SOP 02 and send LinkedIn first touches the same day.

The anti-stage-fright constraint

Once Launch Gate passes, a normal acquisition workday cannot end with zero external reps. Product work, PDFs, Claude branches and content are not allowed to become substitutes for risking a real buyer response.

5. Source of truth + document hierarchy

Use the Drive folder in this order. The router controls sequence; the TODO supports the router rather than replacing it.

Order	Folder	Use
1	00 START HERE	01_START_HERE_2026-09-04.md -> Master SOP Router -> current TODO
2	Claude	THREADLINE_CLAUDE_V11_LAUNCH_HARDENING_PROMPT.md
3	SOPs	Execute only the SOP triggered by the router, plus triggered proof/capacity/SOP/integration SOPs.
4	Current strategy	This V11 Master Blueprint + V11 decision record.
5	Supporting resources	Client, sales, delivery, acquisition, hiring and architecture resources.

Version rule

If a later inherited V9 page conflicts with this V11 front section on launch acquisition, channel priority, paid acquisition or hiring ramp, **V11 wins**. The inherited pages remain useful background and preserve the deeper research/offer/delivery/product architecture work.

Next state

Claude pass -> non-code Launch Gate -> QA/deploy -> LinkedIn outbound -> sales calls -> client #1 -> measured delivery -> proof -> controlled iteration.

Acquisition + Client Experience Architecture

Post-P0 strategy with acquisition OS, recording readiness,
YouTube scope, client portal design and platform integration reality.

V8 CORRECTION

Reviewed source material now maps to executable systems.

Acquisition manual + daily scoreboard

Studio/recording install + YouTube decision

Curated client portal + API approval roadmap

90-Day Offer & Operations Blueprint

A productised founder-content growth system: strategy + software + implementation

POSITIONING
Outcome first

MODEL
Service + system

GOAL
£5k/mo in 90 days

Working principle: build the machine first, then pour attention into it.

1. Executive decision

RECOMMENDED V1 Do not sell "AI automations". Sell a Content Operating System that makes a founder's content operation run with dramatically less management and fewer moving parts.

The offer is a hybrid: strategic consulting + implementation + a client portal + reusable proprietary tools. The client still supplies their expertise and records. Your system handles the research, scripting, planning, workflow, coordination, distribution support and performance feedback loop.

The polished promise

CORE PROMISE We install a content operating system that turns one weekly founder recording session into a repeatable month of researched, scripted, production-ready content - without needing a full in-house content team.

What you are NOT

- Not a generic social-media manager.
- Not a bespoke software-development shop.
- Not "an AI automation agency" selling disconnected workflows.
- Not yet a full CloutProfit-style replacement for every marketing function.

What you ARE

- A productised systems company focused first on founder-led content operations.
- One repeatable backend, configured per client rather than rebuilt from scratch.
- Outcome-led positioning: time saved, output increased, management burden reduced, learning loop improved.
- A service that can become increasingly software-enabled as repeated client needs emerge.

2. Offer architecture

Ideal first customer

Founder-led, high-ticket or high-LTV businesses where the founder's ideas, credibility and face materially influence demand. They already believe in content, but the process is inconsistent, slow or team-heavy.

Good first targets	Why they fit
Coaches / educators / consultants	Founder expertise is the product; content drives trust and calls.
B2B founders selling £3k+ services	A small amount of qualified attention can create valuable pipeline.
Niche experts / personal brands with existing revenue	Already monetised; willing to pay to remove content bottlenecks.
Small online businesses with 2-10 marketing staff/contractors	Clear cost and coordination pain to benchmark against.

Avoid initially

- Pre-revenue creators who want "more views" but cannot value a lead or sale.
- Large enterprises requiring months of security/procurement work.

- Highly bespoke production categories where every deliverable requires custom craft.
- Clients expecting guaranteed virality or guaranteed revenue from content alone.

Client-facing deliverables

Module	What the client experiences
1. Brand Brain	Onboarding captures voice, offer, beliefs, audience, proof, positioning and examples.
2. Market Radar	Competitors, customer language, trends, comments, FAQs and winning angles are collected into a research bank.
3. Idea Engine	Prioritised video ideas with angle, hook, format, objective and CTA.
4. Script Engine	Scripts in the founder's voice with hook variants, teleprompter view and revision controls.
5. Recording Queue	A weekly "film these" dashboard with a short batch-session plan.
6. Production Workflow	Raw files routed to editor / editing workflow, status tracked, revisions controlled.
7. Packaging Tools	Titles, captions, thumbnail concepts, descriptions, repurposing instructions.
8. Publishing Queue	Approved content organised by platform and date; scheduling can be added where technically practical.
9. Performance Loop	Views, retention, engagement, leads/sales where available; winners feed the next research cycle.
10. Founder Dashboard	One portal for tasks, approvals, content bank, stats, tools and progress.

3. The offer weakness audit - and how to fix it

Weakness	Why it hurts	Fix
Too broad	"We automate marketing" creates impossible expectations.	Start with content operations only; add engines later.
AI sounds commoditised	Prospects assume they can just use Claude.	Sell the operating system, context, workflow and implementation - AI is the mechanism.
Hard to prove ROI	Views alone do not justify high ticket.	Target monetised founders and track time saved, output, pipeline attribution and cost displaced.
Risk of bespoke delivery	Every custom build destroys margin.	80-90% core platform; 10-20% configuration.

Weakness	Why it hurts	Fix
No proof at launch	High price without case studies is harder.	Founder cohort / beta pricing in exchange for access, feedback and measurable case study.
Could become an agency job	Manual editing and client requests can balloon.	Define boundaries, standard packages, one weekly approval window and fixed revision rules.
Tool-building rabbit hole	You enjoy building, so you can overbuild before selling.	Build only modules required to demo and fulfil client #1.
Lock-in can feel predatory	"Leave and lose everything" creates distrust.	Client-owned data/assets remain exportable; platform/tool access ends when service ends.
RULE Productise the PROCESS before you productise the SOFTWARE.		

4. Pricing and commercial model

Pricing is a hypothesis until prospects validate it. Do not anchor the price to hours spent building. Anchor it to the operational cost, management time and commercial value of the process being replaced.

Phase	Suggested structure	Purpose
Founding clients	£2k-£3k implementation + £750-£1.5k/mo	Get proof while still charging enough to take delivery seriously.
Validated v1	£3k-£6k implementation + £1k-£2.5k/mo	Standardised system, documented onboarding, credible proof.
Premium later	£7.5k-£15k+ implementation / strategic build	Only after strong case studies, broader integrations and demonstrable economics.

90-day £5k target math

- Two clients at £2.5k/month = £5k MRR.
- One £4k implementation + one £1.5k retainer = £5.5k cash collected in a month.
- Do not make MRR purity a religion at the start: implementation revenue can fund the build while retainers accumulate.

5. Operations SOP - lead to renewal

Stage A - Lead qualification

- ☐ Lead enters CRM with source, company, role, website, audience size and notes.
- ☐ Quick qualification: monetised business? founder-led? content relevant to sales? obvious operational pain? ability to pay?
- ☐ Reject / nurture poor-fit leads. Invite qualified leads to diagnostic call.

Stage B - Discovery & sales call

- ☐ Open with agenda and permission to ask operational questions.

- ☐ Map current content process end-to-end: ideation -> script -> film -> edit -> approve -> publish -> measure.
- ☐ Quantify current cost: staff/contractors, founder hours, delays, missed posting cadence, content backlog.
- ☐ Clarify desired outcome and constraints.
- ☐ Demo the relevant parts of your portal using their workflow as the lens.
- ☐ Present one recommendation, scope, implementation timeline and price.
- ☐ Handle objections; do not overpromise virality or revenue.
- ☐ Close with payment + onboarding call or defined follow-up date.

Stage C - Onboarding

- ☐ Payment received and agreement signed.
- ☐ Create client workspace from master template.
- ☐ Send access checklist: social accounts, analytics, brand docs, prior scripts/content, offers, testimonials, examples.
- ☐ Run 60-minute Brand Brain interview and record/transcribe it.
- ☐ Collect 10-30 examples of content they love/hate and why.
- ☐ Define content goals, platforms, cadence, CTAs and approval owner.
- ☐ Baseline current metrics: output/month, founder hours/week, cost/month, leads/sales where trackable.

Stage D - Implementation

- ☐ Configure Brand Brain and voice profile.
- ☐ Configure niche/competitor research sources.
- ☐ Populate initial research bank and customer-language bank.
- ☐ Generate first 30 idea candidates; manually QA and select best 10-15.
- ☐ Generate first script batch; manually QA against voice and factual accuracy.
- ☐ Connect recording queue and production workflow.
- ☐ Connect editor / assign production owner.
- ☐ Configure packaging and publishing workflow.
- ☐ Connect analytics/data sources that are technically available.
- ☐ Run end-to-end QA with one test piece before launch.

Stage E - Weekly client cadence

- ☐ Monday: dashboard refresh + research/idea refresh.
- ☐ Monday/Tuesday: client receives recording queue.
- ☐ Client records in one defined batch window.
- ☐ Production progresses through fixed statuses: Raw -> Editing -> Review -> Approved -> Scheduled -> Live.
- ☐ One consolidated revision window; avoid constant ad-hoc WhatsApp requests.
- ☐ Friday: performance summary, wins, losses, next-week hypotheses.

Stage F - Monthly review / renewal

- ☐ Report output volume, founder time saved, production cycle time, top content patterns and commercial signals.
- ☐ Compare against onboarding baseline.
- ☐ Agree next-month experiments and any approved scope changes.

- ☐ Identify expansion only after core system is working: email, newsletter, paid creative, lead follow-up, etc.
- ☐ If client exits: export client-owned assets/data; revoke platform/tool access cleanly.

6. Sales script framework

SALES PRINCIPLE Diagnose the broken operating system before pitching your software.

Call section	Prompt / objective
1. Context	"Walk me through how content goes from an idea in your head to something published."
2. Bottleneck	"Where does that process usually slow down or break?"
3. Cost	"How many people and how many of your own hours touch this every week?"
4. Consequence	"What happens commercially when content gets delayed or simply does not go out?"
5. Desired state	"If you only had to record and approve, what would that free you to do?"
6. Gap	Summarise their current process vs desired process in their own language.
7. Mechanism	Show the portal and how the same workflow becomes one integrated system.
8. Scope	Define exactly what is included, what the client must do, implementation timing and success metrics.
9. Price	Anchor against current team/time cost, not feature count.
10. Close	"If we can implement this as scoped, is there anything preventing us from starting this week?"

7. Personal positioning & market identity

Your public identity should not be "AI guy" and should not imitate a social-media-manager persona. Position yourself as an operator who shows founders how to build lean, high-output marketing/content systems.

POSITIONING LINE I build lean content systems for founder-led businesses so they can publish at scale without managing a bloated content team.

What your audience should believe about you after 30 days

- He understands how content businesses actually operate, not just prompts.
- He can turn messy workflows into simple systems.
- He builds useful tools, not generic AI demos.
- He cares about output, speed and economics.
- He is documenting what he is building in public, not pretending to have 100 case studies.

How you differ from personalbrandlaunch-style services

Content consultant / social manager	Your position
Researches ideas for the client	Builds a reusable research engine + workflow the client operates through.
Manual scripts / planning	Software-assisted scripting and content queue built around the founder's brand brain.
Ongoing service labour is the product	The operating system + implementation is the product; service supports it.
Success = posts delivered	Success = output + reduced founder management + faster cycle + measurable learning loop.
Usually dependent on the account manager	Designed to become increasingly standardised and operator-light.

8. Content acquisition system

MAIN ACQUISITION THESIS Teach the market the problem you solve. Your content should make founders notice how inefficient their current content operation is - then show the systemised alternative.

Five content pillars

Pillar	Examples
1. Systems teardown	"Why your editor is not actually your bottleneck"; map a founder's 7-step content workflow.
2. Build in public	Show tools, dashboards, scripting engine iterations, before/after workflows.
3. Cost / time economics	"Your £4k/mo content team is mostly coordination"; compare old vs lean workflow.
4. Tactical expertise	Hooks, scripting, recording batching, repurposing, approval systems, analytics feedback loops.
5. Founder/operator POV	Your beliefs about lean teams, attention, operating leverage, AI as infrastructure not gimmick.

Channel roles

Channel	Role
YouTube	Trust + depth. 1-2 useful videos/week documenting frameworks, builds and teardowns.
LinkedIn	Qualified founder/business-owner reach. 1 strong post/day + comments/networking.

Channel	Role
X	Fast idea testing, operator observations, build-in-public threads.
Reels / TikTok / Shorts	Discovery. Clip strong ideas from long-form; direct viewers toward profile / lead magnet / call.
Cold outreach	Early control channel while organic authority compounds. Use personalised diagnosis/demo, not spam.

Weekly content cadence

Day	Anchor content	Supporting content
Mon	Founder workflow teardown	LinkedIn post + 2 short clips
Tue	Build-in-public tool demo	X thread + 1 short
Wed	Educational YouTube / Loom-style lesson	LinkedIn carousel/text post
Thu	Case / hypothetical redesign	2 shorts + outbound using the example
Fri	Operator POV / contrarian insight	LinkedIn + X + newsletter/email if started
Weekend	Batch record + research	Cut backlog, improve hooks, plan next week

CTA ladder

- Early: "Comment/DM SYSTEM and I'll send the workflow map."
- Middle: free Content Ops Audit / scorecard.
- Qualified: application -> Calendly -> diagnostic call.
- Do not send every cold viewer directly to a £5k sales call; create a value bridge.

9. 30 content ideas to start with

- 1. Why posting more is not a content strategy
- 2. The 8 handoffs killing your content output
- 3. I rebuilt a founder content workflow in 20 minutes
- 4. What I would automate vs never automate in content
- 5. Your editor is probably not the problem
- 6. How one recording session should create a week of assets
- 7. The content-team cost calculator
- 8. I built a script engine that learns your voice
- 9. What a founder should see when they open their content dashboard
- 10. The difference between AI content and an AI content operating system
- 11. Why "hire more people" often makes content slower
- 12. The exact inputs I need before AI can write like a founder
- 13. How I would redesign a coach's content backend

- 14. The weekly content meeting I would delete
- 15. How to turn comments into next week's scripts
- 16. The approval workflow that prevents content sitting for 9 days
- 17. I analysed 50 competitor videos - here is what the system should store
- 18. The 3 numbers a founder should actually track
- 19. Why most content agencies cannot scale their own fulfilment
- 20. What I learned from CloutProfit's offer design
- 21. A content manager vs a content operating system
- 22. How I would give a founder 10 hours back every month
- 23. Building my client portal from scratch: day 1
- 24. What the first client will actually get
- 25. Why I am not selling "AI automation"
- 26. The £10k question: what job/process are you replacing?
- 27. How to productise a service without becoming SaaS
- 28. The 80/20 rule for client customisation
- 29. What happens from signed contract to first published asset
- 30. 90-day challenge: build this business from zero

10. 90-day execution plan

Period	Primary objective	Hard output
Days 1-7	Define + build minimum sellable machine	Offer, ICP, demo portal, landing page, Calendly, pitch deck, CRM, first 20 prospects.
Days 8-30	Sell before overbuilding	30-50 qualified conversations; 5-10 calls; target founding client #1.
Month 2	Deliver + turn delivery into product	Client #1 live; full SOP recorded; case study baseline; close client #2.
Month 3	Scale acquisition around proof	Consistent content + outbound; 2-3 paying clients / implementation cash sufficient to reach £5k+ month.

Kill / pivot criteria

- Do not kill the model because five people ignore outreach.
- After ~30-50 genuinely qualified conversations, recurring objections are data.
- If prospects like the system but will not pay, move the same productisation method to a more expensive pain.
- If they pay but delivery becomes bespoke, narrow scope or rebuild the core workflow before adding clients.

11. Master build checklist

A. Strategy & offer

- ☐ Choose working brand/name
- ☐ Write one-sentence positioning
- ☐ Choose primary ICP
- ☐ Choose explicit exclusions
- ☐ Define core promise
- ☐ Define client responsibilities
- ☐ Define success metrics
- ☐ Set founding-client pricing
- ☐ Set standard pricing hypothesis
- ☐ Write scope boundaries
- ☐ Write revision policy
- ☐ Write implementation timeline
- ☐ Create ROI/time-saved calculator
- ☐ Create offer one-pager

B. Product / backend

- ☐ Sketch portal sitemap
- ☐ Build authentication
- ☐ Build client dashboard
- ☐ Build Brand Brain intake
- ☐ Build voice-profile storage
- ☐ Build market/competitor research bank
- ☐ Build customer-language bank
- ☐ Build idea generator
- ☐ Build idea scoring/prioritisation
- ☐ Build script generator
- ☐ Build hook-variant generator
- ☐ Build teleprompter view
- ☐ Build recording queue
- ☐ Build content status board
- ☐ Build editor handoff
- ☐ Build revision/approval flow
- ☐ Build title/caption generator
- ☐ Build thumbnail-concept generator
- ☐ Build repurposing instructions
- ☐ Build publishing queue

- ☐ Build analytics dashboard v1
- ☐ Build weekly report generator
- ☐ Build client to-do list
- ☐ Build admin view
- ☐ Create master client template
- ☐ Create duplicate/configure workflow
- ☐ Test permissions and data separation
- ☐ Create export/offboarding flow

C. Fulfilment SOP

- ☐ Write lead qualification SOP
- ☐ Write discovery-call SOP
- ☐ Write proposal/quote SOP
- ☐ Write payment SOP
- ☐ Write onboarding SOP
- ☐ Write access-request checklist
- ☐ Write Brand Brain interview script
- ☐ Write initial research SOP
- ☐ Write script QA rubric
- ☐ Write production QA rubric
- ☐ Write weekly cadence SOP
- ☐ Write client communications template
- ☐ Write monthly review SOP
- ☐ Write escalation/bug SOP
- ☐ Write scope-change SOP
- ☐ Write renewal SOP
- ☐ Write offboarding SOP
- ☐ Record Loom walkthroughs for every repeated operator task

D. Sales infrastructure

- ☐ Buy/connect domain
- ☐ Create landing page
- ☐ Write homepage headline + mechanism + CTA
- ☐ Create short VSL / founder video
- ☐ Create Calendly
- ☐ Create application form
- ☐ Create CRM pipeline
- ☐ Create sales deck
- ☐ Create live demo account
- ☐ Write discovery questions

- ☐ Write demo talk track
- ☐ Write price presentation
- ☐ Write objection bank
- ☐ Write follow-up emails
- ☐ Write no-show follow-up
- ☐ Create proposal / work-order template
- ☐ Create agreement template
- ☐ Set payment processor/invoicing
- ☐ Create testimonial/case-study permission clause

E. Acquisition

- ☐ Create LinkedIn profile/page positioning
- ☐ Create X profile positioning
- ☐ Create YouTube channel branding
- ☐ Create IG/TikTok profile positioning
- ☐ Write pinned/start-here post
- ☐ Define five content pillars
- ☐ Create 100-idea content bank
- ☐ Write first 20 LinkedIn posts
- ☐ Write first 20 X posts
- ☐ Script first 10 short videos
- ☐ Script first 3 YouTube videos
- ☐ Batch-record first content
- ☐ Create editing template/style
- ☐ Create thumbnail template
- ☐ Create CTA / lead magnet
- ☐ Build Content Ops Audit
- ☐ Build prospect list of first 100 ICPs
- ☐ Write personalised cold-email framework
- ☐ Write LinkedIn DM framework
- ☐ Create Loom audit template
- ☐ Set daily outreach target
- ☐ Set weekly call target
- ☐ Track source -> call -> close conversion

F. Measurement & management

- ☐ Create daily founder dashboard
- ☐ Create weekly KPI review
- ☐ Track leads by channel
- ☐ Track booked calls

- ☐ Track show rate
- ☐ Track close rate
- ☐ Track cash collected
- ☐ Track implementation hours/client
- ☐ Track recurring support hours/client
- ☐ Track client output/month
- ☐ Track client founder-hours saved
- ☐ Track content cycle time
- ☐ Track content performance patterns
- ☐ Run Friday retrospective
- ☐ Maintain issue log
- ☐ Convert every repeated fix into SOP/tool

12. The first 24 hours

DO THESE BEFORE POLISHING THE LOGO Your goal is to make the business sellable and demonstrable, not "finished".

- ☐ Lock the ICP hypothesis for the first 30 days.
- ☐ Write the one-sentence promise and three bullets of scope.
- ☐ Draw the portal on paper/Figma before coding.
- ☐ Build the full coherent v1 backend from one master specification in a single Claude Code sprint; use one demo client to QA every module end-to-end.
- ☐ Create one convincing demo client inside the portal.
- ☐ Create a one-page landing page with application CTA.
- ☐ Set up Calendly + qualification form.
- ☐ Create a 7-10 slide sales deck.
- ☐ Write discovery script and price hypothesis.
- ☐ Create a CRM board.
- ☐ Build the first 50-prospect list.
- ☐ Write one personalised outreach message and one Loom-audit format.
- ☐ Publish your positioning post on LinkedIn/X.
- ☐ Record the first build-in-public short video.
- ☐ After the build sprint, freeze feature scope for 30 days and book the first five conversations before rebuilding anything except bugs or sales-critical gaps.

13. Final operating principles

- One core system, many configurations - not many custom systems.
- Outcome first, AI second.
- Qualified reach beats massive reach.

- Content creates authority; outbound creates control; proof creates scale.
- Sell before overbuilding, but be operationally ready before flooding the funnel.
- Every repeated task becomes a checklist, SOP, template or tool.
- Every client request does not automatically become a feature.
- Your portal should reduce work, not merely make the service look like SaaS.
- Price against value and displaced cost, not coding hours.
- Build proof honestly. Do not borrow other people's results as your own.
- If this works for you first, your future education offer is backed by lived proof rather than theory.

NORTH STAR Build a machine that you can explain simply, sell confidently, deliver repeatedly and improve every week.

V2 - Market-Informed Offer & Build Specification

DECISION Keep content as the wedge, but build and position the business like a systems company - not a social-media agency and not a generic AI-automation shop.

The refined offer

CORE PROMISE We install a Founder Content Growth OS that learns your business, researches your market, tells you exactly what to record, turns your expertise into production-ready content, manages approvals and distribution, and feeds performance back into the next cycle - so your content operation runs with dramatically less founder time and fewer moving parts.

The client should feel: "I open one portal, see what matters today, record what only I can record, approve what needs approval, and the system handles the rest."

The positioning hierarchy

Layer	Decision
Public category	Founder content / marketing operating systems
What you sell	A repeatable operating system + implementation + strategic oversight
Primary wedge	Founder-led content and the path from expertise -> attention -> qualified conversations
Mechanism	Research, AI-assisted tools, workflows, automation, production coordination, analytics
Why it is premium	It reduces founder time, coordination cost and headcount while increasing throughput and learning speed

Layer	Decision
What you avoid saying	"AI automation agency", "we make posts", "we guarantee virality"

14. What the market already validates

The point is not to clone competitors. It is to use proven patterns so you are not inventing demand from scratch.

CloutProfit

Validated pattern: Best lesson: sell engines and an operating outcome, not isolated automations. Their page packages scripting, funnels, video, distribution and signal/research as one system and anchors price against staff/time costs.

Your adaptation: Use the "one screen / engines / approve only" product experience and cost-displacement framing. Do not copy their breadth or extreme performance claims in v1.

Official site: <https://cloutprofit.com/prelaunch/>

Rethoric

Validated pattern: Best lesson: combine premium human expertise with proprietary software that makes voice capture, review, approvals and publishing easier.

Your adaptation: Use founder interviews, one-click approvals, workflow software and a premium consultancy feel.

Official site: <https://www.rethoric.com/>

Addi London - Content OS

Validated pattern: Best lesson: research first, turn the strategy into an operating playbook, install it into the team workflow, then connect AI to the business context.

Your adaptation: Use evidence-based market research + Brand Brain + a system people actually operate daily.

Official site: <https://www.addi.london/content-os>

BOONT

Validated pattern: Best lesson: position the system as operational leverage - one operator + AI doing work that previously needed a content department.

Your adaptation: Use lean-team economics and repeatable pattern-mining/testing as part of the story.

Official site: <https://www.boont.agency/>

Zelix

Validated pattern: Best lesson: content is more valuable when connected to qualified conversations rather than views alone.

Your adaptation: Add demand-capture paths, CTA tracking and qualified-call reporting where appropriate.

Official site: <https://zelix.in/>

Your synthesis

- PersonalBrandLaunch-style strategic content service: understand the client, research the market, generate ideas and make content easier.
- CloutProfit-style product experience: named engines, one backend, daily action queue, approvals, analytics and automation.

- Rethoric/Addi-style credibility: founder voice capture, research, workflow, approvals and a system that feels operational rather than gimmicky.
- BOONT-style leverage: sell smaller-team economics and throughput.
- Zelix-style commercial layer: connect content to inquiries, calls and pipeline wherever attribution is realistic.

15. Full backend - build it once, then configure

Because Claude Code makes the build cheap in your time, the v1 should feel complete on day one. The discipline is not "build less"; it is "write one master specification, build once, QA once, then freeze scope while you sell."

Engine	V1 function
01 - Client / Offer Brain	Voice, beliefs, offer, ICP, proof, products, objections, CTA rules, examples, banned phrases.
02 - Market Radar	Competitors, customer language, FAQs, breakout content, themes, hooks, offers and research sources.
03 - Signal / Pattern Engine	Store outliers, patterns, formats and hypotheses; tag what is worth testing next.
04 - Idea Engine	Generate and score ideas by audience relevance, novelty, proof, commercial intent and format fit.
05 - Script Engine	Short-form, long-form, VSL/ad variants where in scope; founder-voice guardrails; hook variants; factual QA queue.
06 - Recording Room	Today/this-week queue, teleprompter, filming instructions, batch timer, status and upload.
07 - Production Board	Raw -> edit -> review -> approved -> scheduled -> live; editor handoff, revision notes and asset links.
08 - Packaging Engine	Titles, captions, descriptions, thumbnail concepts, repurposing cuts, platform-specific formatting.
09 - Distribution Queue	Calendar, platform mapping, scheduled assets, publishing status and reminders/integrations.
10 - Performance Loop	Views, retention, engagement, leads/calls where available; winner/loser tagging and next-cycle recommendations.
11 - Pipeline Layer	CTA/lead magnet links, inquiry source, booked-call signal and lightweight commercial attribution when relevant.

Engine	V1 function
12 - Founder Dashboard	One screen: what to record, what to approve, what shipped, what worked, time saved, output and commercial signals.
13 - Admin / Client Config	Duplicate client template, permissions, integrations, usage, support notes, export/offboarding.
14 - Reporting Engine	Automatic weekly summary: shipped, wins, misses, hypotheses, tasks, bottlenecks, client decisions required.

Client responsibility

- Give honest onboarding/context.
- Record the pieces that require the real founder.
- Approve/reject assets in defined windows.
- Give short feedback and supply business updates/proof.
- Take sales calls / fulfil their actual offer.

Your system responsibility

- Research what deserves attention.
- Turn knowledge into ideas/scripts/queues.
- Coordinate the production workflow.
- Package and distribute/schedule within agreed scope.
- Measure signals and improve the next cycle.
- Keep the founder focused on the few actions only they can perform.

16. The one-day Claude Code build sprint

NO-REVISIT RULE By the end of the sprint, the backend should be coherent enough to demo and fulfil. For the next 30 days: bug fixes, security fixes and sales-critical gaps only. No redesign because you saw another cool feature.

Sprint block	Definition of done
0. Master spec - before Claude	Define pages, data model, roles, modules, client configuration, integrations, design system, acceptance criteria and seed demo data.
1. Foundation	Auth, database/schema, tenant separation, admin/client roles, navigation, reusable design components, logging/error states.
2. Context layer	Brand Brain, offer/ICP/proof bank, voice profile, content examples, research sources, customer-language bank.

Sprint block	Definition of done
3. Creation engines	Market Radar, signals, ideas, scoring, scripts, hook variants, teleprompter, recording queue.
4. Workflow layer	Uploads/assets, production board, editor handoff, revisions, approvals, packaging and publishing queue.
5. Measurement	Analytics inputs, content records, winner tagging, weekly report, founder dashboard, time/output metrics.
6. Commercial layer	CTA/lead tracking fields, booked-call signals, simple attribution, client ROI/time-saved calculator.
7. Admin / lifecycle	Duplicate client template, configure integrations, export/offboarding, usage/support notes, audit log where practical.
8. Demo + QA	Seed a convincing demo founder, run the entire flow from onboarding -> script -> record -> approval -> publish -> report; fix broken states.
9. Freeze	Tag v1.0, create issue backlog, stop feature work and move immediately to acquisition.

Master prompt structure for Claude Code

- CONTEXT: what the company sells, the ICP, the promise and the client journey.
- PRODUCT SPEC: every page/module, exact inputs/outputs, user roles and states.
- DATA MODEL: clients, brands, research, ideas, scripts, assets, approvals, posts, metrics, tasks, reports.
- WORKFLOWS: onboarding -> research -> ideation -> scripting -> recording -> production -> approval -> publishing -> performance.
- DESIGN: premium dark/neutral operator aesthetic; fast, minimal, no gimmicky AI-chatbot-first interface.
- INTEGRATIONS: only stable APIs you genuinely need; use adapters/placeholders for integrations not required for demo day.
- ACCEPTANCE TESTS: explicit test cases for every workflow and permission boundary.
- SEED DATA: one high-quality demo client with realistic scripts, tasks, metrics and content assets.
- OUTPUT: build the complete app, run tests, fix errors, seed demo, provide deployment/readme and a backlog of non-blocking future features.

17. Refined sales offer

A clean founding offer should be easy to explain in 30 seconds:

"We install the operating system behind your founder content. It learns your business and voice, researches your market, tells you exactly what to record, manages the workflow around production and approvals, and shows you

what is actually working. Instead of managing a scattered content team, you open one portal and focus on the few things only you can do."

Founding package - hypothesis

Component	Founding offer	Why
Implementation	£2.5k-£4k one-time	Pays for setup, onboarding, configuration and initial content system.
Ongoing	£1k-£2k/mo	Strategy refresh, system operation/support, reports and agreed production coordination.
Client time target	~1 focused recording block + approvals	The dream outcome is reduced management, not "zero human input".
Proof exchange	Founding rate + measurable case study	Baseline founder hours, team cost, output, cycle time and commercial signals.

What you sell against

- Founder hours lost to planning, revisions and coordination.
- Multiple freelancers/staff touching one content asset.
- Slow idea-to-publish cycle.
- Inconsistent output because the system lives in people's heads.
- Generic AI output because the model lacks business context.
- Content that creates attention but has no path to inquiry/call.

18. Your market identity and content plan

POSITIONING LINE I build lean marketing/content operating systems for founder-led businesses - combining strategy, software and AI so small teams can produce more without drowning in coordination.

What you should look like online

- Operator / builder, not "AI automation guru".
- Someone obsessed with leverage, systems, throughput and economics.
- A founder openly building the tools and showing the mechanics.
- Commercially literate: you talk about time, headcount, pipeline and cost - not just prompts.
- Calm, premium, analytical presentation rather than hype-every-post agency-bro branding.

30-day acquisition loop

Channel	Role
YouTube - 1 to 2/week	Deep teardowns, builds and "I rebuilt X workflow" videos. This creates trust and gives you clips.

Channel	Role
LinkedIn - 1 strong post/day	Founder pain, systems economics, build-in-public, teardown screenshots, short case hypotheses.
X - 1 to 3/day	Fast observations, screenshots, system principles, build notes, contrarian operator takes.
Short-form - 4 to 7/week	Clip your strongest concepts and tool demos for Reels/TikTok/Shorts.
Cold outreach - daily	Highly targeted founder messages with one diagnosed bottleneck, one relevant screenshot/Loom, one call to action.
Weekly proof asset	One teardown, calculator, live demo, workflow map or mini case study that makes the offer tangible.

Content series to own

- "I replaced this 7-step founder workflow with one screen."
- "What I would automate vs keep human in a content team."
- "I studied [company]'s content backend - here is the operating system I would build."
- "How much is your content coordination actually costing you?"
- "Building the Founder Content OS from scratch - day X."
- "Why generic AI content sounds generic - context architecture explained."
- "One founder recording session -> the entire content pipeline."
- "What your dashboard should tell you every Monday morning."
- "Why views are not enough: content -> conversation -> pipeline."
- "How small teams can out-produce big marketing teams."

19. Revised launch order - now that the backend is a one-day build

#	Action	Deliverable	Rule
1	Lock first ICP for 30 days	Pick one monetised founder segment. Do not change after three ignored DMs.	Complete before next step.
2	Lock promise + founding price	One sentence, 3 scope bullets, client responsibilities, success metrics.	Complete before next step.
3	Write master Claude spec	Everything above becomes one build document - no improvising mid-build.	Complete before next step.

#	Action	Deliverable	Rule
4	One-day backend build	Build, seed demo, QA and deploy v1.0.	Complete before next step.
5	Sales infrastructure	Site, Calendly, qualification form, CRM, proposal/work order, deck, demo account, scripts.	Complete before next step.
6	Acquisition setup	Profiles, first content bank, lead magnet/audit, first 100 prospects, outreach scripts.	Complete before next step.
7	Launch	Publish + outreach immediately. The system is now frozen.	No feature creep.
8	Conversation loop	30-50 qualified conversations. Log every objection and desired outcome.	No feature creep.
9	First client	Configure the existing system - do not rebuild. Document onboarding and implementation.	No feature creep.
10	Proof + scale	Turn baseline/results into case study; increase price; compound content + outbound; paid acquisition only after conversion proof.	Scale only what converts.

20. Non-negotiables

- Build the full v1 once because your coding cost is low; do not keep rebuilding because your attention cost is high.
- The backend must make the service easier to fulfil - it is not decoration.
- One core codebase; client configuration, not client-specific apps.
- The client should understand the outcome without caring what model/API is underneath.
- Do not promise virality, revenue or staff replacement you cannot prove.
- Track founder hours saved, output, cycle time, content patterns and commercial signals from day one.
- Qualified reach beats massive reach. A 5k-person audience of the right founders can be more valuable than 500k random views.
- Content builds authority; outbound gives you control; proof unlocks paid acquisition and higher pricing.

- After 30-50 qualified conversations, repeated objections are market data. Change the promise/ICP before throwing away the whole model.
- Your 90-day target remains £5k+/month of business income; two or three strong clients is enough to prove the machine.

Source notes

Competitor observations in this V2 are based on the official public websites of CloutProfit, Rethoric, Addi London, BOONT and Zelix, reviewed September 2026. Their claims and case-study figures are their own; use them as positioning/offer-design references, not as proof of your results.

NORTH STAR Build once. Configure repeatedly. Sell the outcome. Prove the economics. Turn every repeated action into software, SOP or template.

PART II

From signed client to measurable value

This section answers the missing question: exactly what happens, who does what, where AI helps, what the client receives, and what Threadline must do next.

THE SERVICE

Threadline takes responsibility for turning a client's expertise into a continuously improving content growth engine: market intelligence, positioning, creative strategy, scripting, production, distribution and performance learning.

THE CLIENT

Gives business context, records in focused batches, approves key decisions and reports commercial outcomes. They should not be doing market research for us.

THE OS

Threadline OS is delivery infrastructure. It stores context, evidence, lineage, tasks and learnings so the service compounds instead of restarting every month.

01

Who pays - and what hurts enough

Sell to businesses where one qualified customer is valuable and expert credibility affects purchase decisions.

PRIMARY ICP

Expert-led B2B/service businesses doing roughly £300k-£5m+ annual revenue, usually selling £5k+ engagements or high-LTV offers. Best first wedge: consultants, agency owners and specialist service founders.

THE EXPENSIVE PROBLEM

Their expertise is not being converted into enough high-quality attention, authority and qualified demand. Content is inconsistent, generic, poorly positioned, weakly connected to the offer, or not

THE SECONDARY PROBLEM

The founder is also the human API: briefing, reviewing, chasing editors, deciding topics and interpreting analytics. The workflow amplifies the strategic problem but is not the headline.

DISQUALIFY

Pre-revenue creators, weak/unproven offers, people who only want views, clients unwilling to record, and businesses where an extra customer is too low-value to support the fee.

The offer - not the software

The client is buying a managed growth outcome. The portal is how Threadline delivers it with leverage and continuity.

FIND THE MESSAGE

Research the market, understand the buyer, sharpen positioning, identify themes, beliefs, proof and angles worth owning.

TURN IT INTO MEDIA

Ideas, hooks, scripts, recording plans, editing, repurposing, packaging and publishing.

LEARN WHAT CREATES DEMAND

Track performance and commercial signals, identify winners/losers and feed the learning into the next cycle.

CLIENT-FACING PROMISE

We build and run the content growth engine behind your expertise. You record and approve; Threadline researches your market, develops the strategy, turns it into content, manages production and distribution, then improves what gets made based on what actually earns attention and qualified conversations.

03

A to Z - the first client launch

A signed client should move through one repeatable implementation sequence. No improvising a different service for each account.

DAY 0 - CLOSE

Agreement signed, setup + first month paid, workspace cloned, welcome and access checklist sent.

DAYS 1-2 - CONTEXT

Client completes onboarding; you run a 60-90 minute strategy / Brand Brain interview.

DAYS 1-3 - DIAGNOSIS

Audit positioning, audience, offer alignment, content-market fit, differentiation, creative, distribution, conversion and operations.

DAYS 2-3 - INTELLIGENCE

AI researches the market and competitors; Threadline stores evidence and candidate signals; you approve what matters.

DAY 3 - STRATEGY

Lock 30-day themes, messages, formats, platforms, recurring series, CTAs and commercial hypotheses.

DAYS 3-4 - CREATION

AI proposes ideas/scripts; you QA the best; client receives a focused recording queue.

DAY 4/5 - RECORD

Client records; raw footage enters Threadline and moves to the editor.

WEEK 2+ - LOOP

Edit → QA → approval → publish → measure → extract learning → next intelligence run.

How Intelligence actually works

The client should open Intelligence and see work Threadline has done for them - not a blank database asking them to research their own market.

INPUTS

Client website + offer + ICP + Brand Brain + chosen competitors + customer/community sources + relevant searches + historic content + performance and inquiry data.

AI INTELLIGENCE RUN

AI does breadth: searches approved public sources, extracts customer language, pains, objections, competitor themes, breakout content, recurring hooks, offer shifts and possible content gaps. Every important finding keeps source evidence and a link/citation where available.

YOUR REVIEW

You do judgment: reject noise, spot misleading correlations, decide whether a signal fits positioning, and promote the strongest findings into content hypotheses. AI proposes; you decide.

05

What the client should receive

Raw research is not the deliverable. Threadline turns evidence into an ordered set of decisions and tests.

MONDAY INTELLIGENCE BRIEF

"Here are the 3-5 things we are seeing in your market, the evidence behind each, why it matters, and what we recommend testing this week."

SIGNAL

Buyers repeatedly describe the problem as "we have data but no decision." Evidence: 14 comments, 4 sales objections, 2 competitor outliers.

INTERPRETATION

The pain is decision paralysis, not lack of reporting. Generic "better dashboards" content is likely too shallow.

TEST

Create a founder POV series around "more dashboards will not fix decision-making."

06

What we can borrow from gtm.help

Different product, useful design lesson: reduce uncertainty by turning research into a ranked action plan rather than dumping advice on the user.

WHAT GTM.HELP DOES WELL

Starts with a website, infers the business and competitors, lets the user confirm what it understood, asks only a few goal/budget/time questions, then ranks concrete growth plays with effort, cost, rationale and ready-to-use assets. The research behind the recommendation is inspectable.

1 START WITH WHAT WE CAN INFER

Threadline should prefill as much as possible from the client website and onboarding inputs instead of asking them to type everything manually.

2 SHOW WHAT WE UNDERSTOOD

Before strategy, present a concise "this is what we think your business/ICP/offer is" review for correction.

3 RANK ACTIONS, NOT INFORMATION

Signals should become a ranked weekly list of content tests with expected upside, effort and evidence.

4 MAKE EVIDENCE INSPECTABLE

Every recommendation should let the client or operator see the source research and why it was promoted.

5 DRAFT THE WORK

Once a test is approved, Threadline should immediately generate the ideas/scripts/assets required to run it.

AI does breadth. You do judgment.

This is the operating model. You do not need an operator before revenue if AI can compress collection and administration enough.

AI

Market research breadth, extraction, clustering, candidate signals, first-pass ideas/scripts, performance summaries and report drafts.

YOU

Sales, onboarding interview, strategy, approving market conclusions, choosing angles, high-level creative QA and monthly client review.

EDITOR

Turns raw recordings into polished media according to the Threadline brief and revision workflow.

CLIENT

Provides expertise/context, records, approves key decisions and feeds back real sales/commercial outcomes.

HIRING RULE

Do not hire an operator because the model “sounds operational.” First compress the work with AI. Hire only when repetitive research/admin remains a real capacity constraint across several paying clients.

08

The weekly machine

Once onboarding is complete, delivery should feel boringly repeatable.

MONDAY

AI Intelligence Run + performance refresh. Threadline produces candidate signals, ideas and recommendations. You spend ~30-45 min reviewing.

TUESDAY

AI drafts scripts for approved ideas. You spend ~30-45 min on hooks, specificity, voice, proof, fact-checking and CTA. Recording queue goes live.

WEDNESDAY

Client records in one focused batch. Raw footage routes to the editor through Production.

THURSDAY

Editor returns assets. You perform quick creative QA; client receives one consolidated approval batch.

FRIDAY

Approved content is scheduled/published. Threadline generates weekly learning: what shipped, what worked, what created interest, what to test next.

09

Your workload should be judgment-heavy

If you are spending 15-20 hours per client on manual research and admin, the delivery model is wrong.

TARGET PERSONAL WORKLOAD

Aim for roughly 5-8 hours per client per month once the system is stable: intelligence review, creative/script QA, production QA, client communication and a monthly strategy call.

MONTHLY STRATEGY REVIEW

Review winning/losing messages, content quality, output, audience response, qualified inquiries, founder time, market changes and

AUTOMATE / DELEGATE

Competitor collection, comment extraction, data entry, posting, metric ingestion, repetitive tagging, editing and routine reporting should

THE RETENTION EFFECT

Month 6 should be better than month 1 because Threadline has accumulated the client's customer language, tested messages, hooks, failures, winners, objections, inquiries and founder-specific patterns.

10

Exactly how to sell it

Diagnose business/content pain, not workflow inconvenience. The software comes in as proof of the mechanism.

1 ECONOMICS

What do you sell? What is a customer worth? How important is founder/expert credibility to the sale?

2 CONTENT PAIN

What is not working: positioning, quality, consistency, right audience, conversion, or learning?

3 CURRENT PROCESS

How many people/tools/founder hours are required to make content today?

4 CONSEQUENCE

What does weak/inconsistent content mean commercially? What opportunities are being missed?

5 DESIRED STATE

If you only had to provide expertise, record and approve, what would that unlock?

6 REFRAME

"You do not need another posting tool. You need a market-to-content-to-pipeline system that gets better every cycle."

7 DEMO ONE LOOP

Research evidence → signal → idea → script → recording → edit → publish → performance → inquiry → next recommendation.

8 OFFER / CLOSE

Sell the managed 3-month engagement. Do not sell 43 routes or AI tokens.

11

What the market can plausibly pay

The price only works when Threadline owns strategy + execution + learning, not when it merely gives the client a nicer workflow.

FOUNDING HYPOTHESIS

£2,500 implementation + £2,500/month, three-month initial engagement. Initial contract value: £10,000. Keep one offer while learning what buyers value.

WHY IT CAN WORK

For a £5k-£20k+ service business, one incremental customer every few months can justify the engagement. Threadline can also reduce founder drag and replace/coordinate fragmented strategy, writing, editing and content-management work.

WHEN TO RAISE

After 2-3 credible cases showing better content quality, output, founder-time reduction and commercial signals, test £3k-£5k implementation + £3k-£5k/month depending on production scope.

12

The to-do list now

v1 is built. These priorities supersede the old pre-build checklist. Do not disappear back into product development.

1 BROWSER QA

Walk the real demo at desktop/tablet/mobile. Test teleprompter, command menu, demo tour, application flow and report print.

2 INTELLIGENCE RUN

Build or configure the AI research workflow: source list → evidence → candidate signals → review → approved tests. Keep sources inspectable.

3 DEPLOY

Move to a real hosted environment with production database/storage choices and safe credentials.

4 EDITOR BENCH

Identify 1-2 reliable freelance editors, define turnaround, price, revision rules and a Threadline handoff template.

5 LOCK THE PACKAGE

Set monthly asset range, channels, recording cadence, revision boundaries, what "publishing" includes, and exclusions.

6 SALES DEMO

Record a 3-5 minute demo of ONE closed loop, not a feature tour.

7 SALES ASSETS

One-page offer, discovery script, proposal/work order, 3-month agreement, payment/invoicing and onboarding email.

8 FIRST 100 PROSPECTS

B2B consultants / agencies / specialist service founders with valuable offers and visible content pain.

9 CONTENT + OUTBOUND

Publish proof-of-mechanism content and send personalised diagnoses daily. Goal: conversations, not followers.

10 FIRST CLIENT

Configure the existing system; do not rebuild it. Measure baseline from day one and document every repeated delivery step.

What we are not doing now

The main risk is no longer “can we build it?” It is hiding in product work instead of validating demand.

NO FEATURE CREEP

Do not add email, paid ads, funnels, CRM automation, semantic search or dozens of integrations because they sound impressive. Add only after a real client need repeats or blocks a sale.

NO MANUAL MARTYRDOM

Do not prove value by personally doing 10 hours of internet research per client. Use AI for breadth, preserve evidence, and spend your time on judgment and creative strategy.

PROOF TO CAPTURE FROM CLIENT #1

Baseline and track: content quality/consistency, output, founder hours, production cycle time, approval time, audience quality, top themes/hooks, qualified inquiries/calls, and any attributable sales signals. Never promise causality you cannot prove.

NORTH STAR

01

Sell the result. Use AI to make fulfilment unfair.

THE CORE LESSON

Pick a market where one new customer is economically meaningful. Sell the old desire - more qualified demand and less founder drag - through a new mechanism. Do not make the market learn to want “a content operating system.”

THREADLINE SELLS

A managed content growth engine that turns expert knowledge into better messages, consistent media and qualified demand - while taking almost the entire operation off the client.

THREADLINE OS DOES

Stores context and evidence, coordinates the loop, generates first drafts, tracks lineage, measures results and remembers what the market taught us.

CAMERON PRINCIPLES WE ADOPT

- Rich market first: one customer should justify a meaningful chunk of the fee.
- One niche / one system: standardise fulfilment, not bespoke client-by-client chaos.
- AI behind the scenes: automate research, prep, analysis and reporting; humans keep judgment and craft.
- Fast first result: deliver an obvious win inside the first seven days.
- Proof over promises: baseline the client, track outcomes, and let the first cases sharpen the offer.

02

Narrow the first market by economics, not job title

FIRST 30-DAY ICP

Established B2B consultants, specialist agencies and expert-led service firms with roughly £500k-£5m+ revenue, a proven £5k+ offer, visible content potential, and capacity to take more qualified demand.

QUALIFY HARD

CUSTOMER VALUE

A new customer is usually worth £5k-£50k+.

PROVEN OFFER

They already sell something people buy.

EXPERTISE-LED SALE

Trust in the founder/expert affects conversion.

CONTENT PAIN

Current content is weak, inconsistent, generic or under-leveraged.

CAPACITY

They can actually fulfil additional demand.

DO NOT CHASE

Pre-revenue creators • low-ticket offers • vanity-view buyers • clients unwilling to record • businesses where one extra customer barely covers the fee • enterprise procurement-heavy accounts.

03

A strong offer needs a fast, visible first win

Threadline should feel valuable before the client has waited months for attribution. The first week must

CLIENT-FACING PROMISE

We turn your expertise into a continuously improving content engine that earns attention and creates qualified demand. You provide expertise, record and approve; Threadline researches, strategises, scripts, manages production and learns from results.

DAY-7 WIN

DAY 1

Business + offer + audience captured.

DAY 2-3

Market intelligence: 5 meaningful findings with evidence.

DAY 3

3 messages / angles to own + 30-day hypothesis.

DAY 4

First 6-8 researched scripts ready to record.

DAY 5-7

Founder records; first assets enter production.

FOUNDING COMMERCIAL MODEL

PRICE HYPOTHESIS

£2,500 setup + £2,500/month. 3-month initial engagement. One offer while we learn. Do not add Bronze/Silver/Gold before proof.

SAFE GUARANTEE

Guarantee delivery milestones we control, not revenue we do not. Example: first researched strategy + recording-ready batch within an agreed window, or we keep working at no extra fee until complete - subject to client inputs.

04

Build the research layer so AI does the breadth

This is the main sales-critical product addition. The client should see research Threadline completed for them, not a research database they have to populate themselves.

INPUTS

SOURCE PACK

Website • Brand Brain • offer • ICP • approved competitors • creators • customer reviews/comments • relevant communities/searches • sales-call notes/transcripts • historic content • performance • pipeline

AUTOMATED RUN

RESEARCH → EVIDENCE → CANDIDATE SIGNALS

Use web/search-capable research tools or adapters to gather public evidence. Extract customer language, pains, objections, competitor themes, outliers, recurring hooks, offer shifts and content gaps. Every finding must preserve source URL, source type, captured excerpt/summary, timestamp and confidence. Deduplicate before review.

HUMAN REVIEW

YOU APPROVE

Reject noise, challenge misleading correlations, choose what fits positioning, promote only the strongest evidence-backed signals.

THREADLINE EXECUTES

Approved signal instantly creates ranked tests, ideas and scripts. Performance later feeds back into signal confidence.

CLIENT OUTPUT

Monday Intelligence Brief: 3-5 ranked market findings → why each matters → evidence → recommended content test → expected upside/effort → scripts ready once approved.

05

What Claude should build now - and nothing else

The current app is already complete and tested. This brief is an upgrade pass, not a rebuild. Claude must read HANDOFF.md first and preserve the existing architecture/security invariants.

P0 · INTELLIGENCE RUN

Multi-source research-run object; source configuration; evidence ingestion; dedupe; candidate-signal generation; inspectable citations; approve/reject; convert approved signal into ranked tests/ideas.

P0 · CONSTRAINT DIAGNOSIS

Add a client "Current Growth Constraint" assessment across positioning, audience, offer alignment, content-market fit, differentiation, creative, distribution, conversion and operations. One primary constraint + evidence + next action.

P0 · DAY-7 WIN

Installation milestone page/checklist: onboarding complete → intelligence brief → strategy → first scripts → recording → production. Visible status internally; client sees only useful progress.

P0 · PROOF CAPTURE

Baseline + monthly before/after fields: founder hours, output, cycle time, approval time, engagement quality, qualified inquiries/calls, attributable sales signal. Case-study export view later.

P0 · WEBSITE / UX PASS

Reframe the public site around the outcome and one clear story. Improve visual hierarchy, motion, product storytelling, screenshots and mobile conversion without copying CloutProfit.

06

Make Threadline feel like a premium managed growth offer

Borrow the confidence, contrast and mechanism-led storytelling that makes CloutProfit feel expensive - not its copy, layouts, graphics or claims.

PUBLIC SITE STORY

- 1 OUTCOME** Turn your expertise into qualified demand.
- 2 PAIN** Good expertise is trapped inside weak messaging, inconsistent content and fragmented execution.
- 3 MECHANISM** Market intelligence → strategy → content → distribution → commercial feedback.
- 4 YOUR ROLE** Give context. Record. Approve. Sell.
- 5 OUR ROLE** Research, strategy, scripting, production, packaging, distribution workflow, optimisation.
- 6 PROOF** Show the real OS loop and founding-program evidence as it emerges.
- 7 CTA** Apply for a 30-minute content growth diagnosis.

UX RULES

- One dominant CTA per viewport; sticky CTA after the hero on desktop/mobile.
- Use real product screenshots as evidence of mechanism, not a 43-feature gallery.
- Reveal the loop progressively; each section should answer one buyer question.
- Use subtle motion/scroll transitions and restrained gold accents; no neon AI aesthetic.
- Put “You do / Threadline does” high on the page to reduce perceived effort.
- Application form should feel like diagnosis, not admin: short first step, deeper qualification second.

07

Recommended homepage structure

Keep the current premium dark system. Improve conversion through hierarchy, proof-of-mechanism and a cleaner narrative rather than decorative complexity.

HERO

Turn your expertise into qualified demand.

Threadline researches your market, finds the messages worth owning, turns them into high-quality content, runs the production system around you and learns what creates qualified conversations.

Apply for Threadline

PROBLEM

Your expertise is valuable. Your content system is not.

Show 4 failure states: weak positioning, random topics, founder bottleneck, no learning loop.

MECHANISM

One loop that gets smarter every week.

Interactive/animated 7-step loop: Intelligence → Strategy → Create → Record → Produce → Distribute → Learn.

See the system

INTELLIGENCE

Know what to say before you press record.

Show a real Monday Intelligence Brief with evidence and ranked tests.

CLIENT EFFORT

You do three things.

Provide expertise • record • approve. Threadline owns the rest of the content machine within scope.

FAST START

Your first useful output in 7 days.

Show Day-7 sequence and expectation management.

FIT

Built for expensive expertise.

B2B consultants, specialist agencies and expert-led service firms with proven £5k+ offers.

CTA

Apply for a content growth diagnosis.

Make the application feel selective and diagnostic, not like SaaS signup.

Apply

08

Copy-ready post-v1 superprompt - part 1

Use this instead of the original build prompt. It tells Claude to preserve the working v1 and implement only the current sales-critical upgrades.

PASTE THIS INTO CLAUDE CODE

You are acting as Threadline's founding CTO, product designer and staff engineer. This is an EXISTING production-quality v1, not a greenfield rebuild. FIRST: read HANDOFF.md top to bottom, then docs/BUILD_CHECKLIST.md, docs/ARCHITECTURE.md, docs/PRODUCT_SPEC.md and FUTURE_BACKLOG.md. Audit the current repo and verify the documented state before changing anything. Preserve all security, tenancy, workflow, AI-abstraction and one-codebase invariants. BUSINESS UPDATE: Threadline is a managed content growth service for high-LTV expert-led B2B businesses. We do not sell software access. We sell a managed outcome: market intelligence + positioning/creative strategy + content execution + performance/commercial learning. The client provides expertise, records, approves and sells. Threadline/AI handles the surrounding machine. DO NOT rebuild finished modules. DO NOT add speculative backlog features. Implement only the P0 upgrades below, using existing models/services where possible and migrations only where truly needed.

09

Copy-ready post-v1 superprompt - part 2

CONTINUE THE SAME PROMPT

P0-1 INTELLIGENCE RUN Create a first-class IntelligenceRun workflow. A run receives the client's approved source configuration, Brand Brain, offer/ICP, historic content/performance and optionally sales notes. It gathers or accepts public-source evidence through safe adapters/tools, preserves source URLs and timestamps, deduplicates evidence, generates candidate signals with confidence/rationale, and requires human approve/reject before a signal can influence strategy. Approved signals can create ranked content tests and seed ideas/scripts. Never invent a source or simulate a connection. P0-2 CONSTRAINT DIAGNOSIS Add a structured diagnosis across positioning, audience, offer alignment, content-market fit, differentiation, creative quality, distribution, conversion and operations. Store one primary current constraint, supporting evidence, severity and recommended next action. Surface it in onboarding/admin and monthly strategy review. P0-3 DAY-7 WIN Add an internal/client-safe installation milestone flow: context complete, diagnosis complete, first intelligence brief, strategy approved, first scripts ready, recording completed, first assets in production. Make progress clear without turning the client experience into project-management bloat. P0-4 PROOF CAPTURE Add baseline/monthly proof fields and comparison views for founder hours, content output, cycle time, approval time, audience quality, inquiries, booked calls and attributable sales signals. Never imply causality where only correlation exists. P0-5 WEBSITE / UX Keep Threadline's original dark/champagne design language but redesign the public site around the managed outcome. Do not copy CloutProfit. Use stronger hierarchy, larger outcome-led typography, generous whitespace, restrained motion, progressive mechanism reveal, real product screenshots, one dominant CTA, a clear You-do / Threadline-does section, Day-7 first-win section, fit/disqualifier section and a short diagnostic application flow. The site must feel premium, decisive and easy to understand in under 20 seconds. QA: update tests where needed, run typecheck/lint/tests/build, manually verify critical new routes/states, update HANDOFF.md and FUTURE_BACKLOG.md, then stop. No additional features.

10

Where Threadline is actually at

These are execution-readiness ratings, not hype. The software is unusually far ahead; the business proof is not.

Scalability architecture

BUILD READINESS

9/10. The machine exists. Technical risk is now a secondary problem.

MARKET VALIDATION

~3/10. Until someone pays and stays, the business thesis is still a hypothesis.

11

The next 30 days - in order

This list supersedes every earlier build-era checklist in the master document.

- 1 BROWSER QA** Finish visual QA on the real app at desktop/tablet/mobile.
- 2 CLAUDE P0 UPGRADE** Build Intelligence Run + constraint diagnosis + Day-7 win + proof capture + site UX pass.
- 3 DEPLOY** Production database/storage, safe credentials, private demo URL.
- 4 EDITOR BENCH** Lock 1-2 freelancers, turnaround, revision rules, per-client economics.
- 5 LOCK ONE OFFER** £2.5k setup + £2.5k/mo, 3 months; exact asset range/channels/recording cadence/exclusions.
- 6 SALES DEMO** 3-5 minute loop: evidence → signal → idea → script → record → publish → performance → inquiry → next test.
- 7 SALES ASSETS** One-page offer, deck, discovery script, proposal/work order, agreement, onboarding email.
- 8 FIRST 100** High-LTV B2B consultants/agencies/specialist services with visible content pain.
- 9 OUTBOUND + CONTENT** Daily personalised diagnoses; proof-of-mechanism content; no waiting for an audience.
- 10 CLIENT #1** Configure, deliver Day-7 win, baseline everything, turn the engagement into proof.

12

What not to do next

The danger has flipped: building is easy enough that it can become procrastination disguised as progress.

NO PRODUCT ESCAPE

After the P0 upgrade, freeze again. No email engine, ad engine, funnel builder, mobile app or CRM automation until a repeated paying-client need earns it.

NO FAKE AUTOMATION

If research collection cannot be automated reliably from a source, keep an honest manual/URL path. Never invent citations, performance or connected states.

DECISION RULES

- If prospects do not understand the offer, change the message before changing the software.
- If prospects understand but do not care, revisit ICP/pain/economics after 30-50 qualified conversations.
- If they buy but delivery becomes custom, narrow scope and standardise before adding volume.
- If a manual step repeats across several clients, then automate or delegate it.
- If client #1 gets results, make proof the centre of acquisition before adding breadth.

NORTH STAR

Choose a rich market. Sell a painful economic outcome. Standardise one fulfilment machine. Let AI do breadth and repetitive prep. Keep human judgment where it changes quality. Prove the result. Then scale what converts.

Original Claude Code Build Specification

Historical reference. v1 has already been built and verified. Use the V6 post-v1 upgrade superprompt for current development work.

STATUS

The original specification is retained because it documents the architecture and intent of the current product. It is not the active to-do list.

THREADLINE

Claude Code Build Superprompt

Full product specification • UX system • onboarding • workflows • QA • handoff

BUILD PHILOSOPHY Build the complete coherent v1 in one focused sprint. Then freeze feature scope for 30 days and move immediately into selling, conversations and proof.

Working brand: THREADLINE

Product: Threadline OS

Category: Founder marketing/content operating systems

Business model: premium implementation + strategic service + reusable proprietary backend

North star: The founder opens one portal, records what only they can record, approves what only they can approve, and the system handles the operational complexity around them.

How to use this document

This is designed to be handed to Claude Code as the source-of-truth build brief. The build should create the specifications on disk first, then execute them. Do not let Claude silently reduce scope to a toy MVP.

Step	Action	Rule
Step 1	Paste the full prompt	Give Claude Code the entire specification in one session.
Step 2	Let it audit the repo	It should inspect the codebase, dependencies and environment before choosing architecture.
Step 3	Require docs first	PRODUCT_SPEC.md, ARCHITECTURE.md, DATA_MODEL.md, BUILD_CHECKLIST.md and ACCEPTANCE_TESTS.md.
Step 4	Build end-to-end	The product must work as connected workflows, not disconnected screens.
Step 5	QA and seed demo	Run tests, lint, typecheck, production build and a realistic demo workspace.
Step 6	Create HANDOFF.md	A fresh Claude session should be able to continue by reading one file.
Step 7	Freeze v1	Bugs/security/sales-critical gaps only for 30 days. Everything else goes to backlog.

IMPORTANT Claude is allowed to make sensible implementation decisions, but it is not allowed to delete major product modules just because the scope is large.

1. Brand, category and commercial framing

THREADLINE is not positioned as an AI agency. AI is infrastructure inside a premium operating system. The buyer should understand the outcome even if they do not care which model or API powers it.

Layer	Decision
Brand	THREADLINE
Product	Threadline OS

Public category	Founder marketing/content operating systems
What is sold	A repeatable operating system + implementation + strategic oversight
Primary wedge	Founder-led content: expertise → attention → qualified conversations
Mechanism	Research, context, AI-assisted creation, workflow automation, production coordination and analytics
Premium rationale	Less founder time, lower coordination burden, fewer moving parts, higher throughput and faster learning
Avoid saying	“AI automation agency”, “we make posts”, “guaranteed virality”

Core promise

CORE PROMISE We install the operating system behind your founder content. It learns your business and voice, researches your market, tells you exactly what to record, manages the workflow around production and approvals, and shows you what is actually working - so you can publish at scale without managing a scattered content team.

The client should feel

“I open Threadline and immediately know what matters today. I record the things only I can record, approve the things only I can approve, and the system handles the operational complexity around me.”

Initial ICP

- Monetised founder-led businesses where the founder’s expertise, face, opinions or credibility materially influence acquisition.
- Consultants, educators, established coaches, high-ticket service founders, B2B founders, niche experts and monetised personal brands.
- Avoid hobby creators, clients who only want vanity views, large-enterprise procurement cycles and clients demanding guaranteed virality.

2. Brand design system

The product should feel like premium operator software: calm, precise, slightly futuristic and commercially serious. It should not look like an agency template or a neon “AI SaaS” starter kit.

Token	Direction
Background	#0B0D0F near-black charcoal
Secondary surface	#111418
Elevated cards	#161A1F

Primary text	#F5F2EB warm white
Secondary text	#9CA3AF muted neutral
Accent	#C8A96B muted champagne / antique gold
Positive	restrained emerald
Negative	restrained red
Warning	muted amber

Visual rules

- Dark-first; excellent hierarchy; generous spacing; restrained accent colour.
- Desktop should feel like a founder command centre, while mobile remains genuinely usable.
- Use a modern sans-serif for UI and optionally an editorial serif only for rare marketing emphasis.
- Gold is for selected states, premium moments and critical metrics - never everywhere.
- No giant glowing brains, robots, generic chatbot-first UI, childish gamification or meaningless vanity charts.
- Create a minimal THREADLINE wordmark and a simple continuous-line / signal-path symbol.

3. Product architecture

ARCHITECTURE RULE One codebase. One core system. Multi-tenant by design. Each client gets configuration, not a bespoke application.

Two experiences

- Client Portal - simplified, founder-facing, action-oriented.
- Internal Admin / Operator Portal - cross-client operations, configuration, support and lifecycle management.

Roles

- super_admin
- internal_operator
- client_admin
- client_member
- editor / contributor

Primary client navigation

- HOME
- INTELLIGENCE
- CREATE
- PRODUCTION
- DISTRIBUTION
- PERFORMANCE
- PIPELINE

- LIBRARY
- SETTINGS

4. Full v1 feature map

Engine	What it does	Design intent
01 • Client / Offer Brain	Company, offer, ICP, founder biography, voice, proof, content rules and compliance guardrails.	Structured context that every AI feature can reuse.
02 • Market Radar	Competitors, customer language, FAQs, objections, trends, breakout content, hooks and research sources.	Manual + URL input in v1; adapter-ready for future ingestion.
03 • Signal / Pattern Engine	Outliers, patterns, hypotheses, tests and learnings linked to evidence.	Prioritise what deserves testing next.
04 • Idea Engine	Generate, score, shortlist and manage content ideas.	Uses brand context + market evidence + performance history.
05 • Script Engine	Short-form, YouTube, founder POV, educational, case study, objection-handling and optional VSL/ad variants.	Voice guardrails, hook variants, version history and factual QA states.
06 • Recording Room	Today/this-week queue, teleprompter, filming instructions and upload.	Founder should be able to batch-record with almost no planning.
07 • Production Board	Raw → Editing → Review → Changes → Approved → Scheduled → Live.	Editor assignment, structured revisions, asset links and history.
08 • Packaging Engine	Titles, captions, descriptions, thumbnail concepts, overlays, CTAs and repurposing instructions.	Platform-specific, not copy-paste identical.
09 • Distribution Queue	Calendar/list with platform mapping, dates, status and published URLs.	Real integrations where available; honest manual fallback otherwise.
10 • Performance Loop	Views, retention, engagement, leads/calls, winners/losers and next tests.	Feeds learnings back to Signal and Idea engines.
11 • Pipeline Layer	CTA, lead magnet, source content, inquiry, qualified lead, booked call, sale and attributed value.	Lightweight commercial attribution, not a CRM clone.

12 • Founder Dashboard	One screen: record, approve, shipped, performance, time saved, output and commercial signals.	The main daily command centre.
13 • Admin / Client Config	Tenant creation, package, modules, integrations, permissions, support notes and offboarding.	Duplicate master template; never fork per client.
14 • Reporting Engine	Automatic weekly executive summary of shipped, wins, misses, learnings, next tests and required actions.	Client-facing proof and operating cadence.

5. Connected workflow - not disconnected tools

DATA LINEAGE Research Signal → Idea → Approved Idea → Script → Approved Script → Recording Queue → Raw Asset → Edit → Review → Approval → Packaging → Distribution → Published Content → Performance → Commercial Signal → Learning → New Idea

Every published asset should be traceable back through its research evidence, idea, script, selected hook, approvals, publication, performance, any commercial signal and the learning extracted from it. This is how Threadline becomes organisational memory rather than a collection of generators.

6. Founder Command Centre

This is the most important screen. A founder should open Threadline on Monday morning and immediately know what they need to do.

Block	Contents	Purpose
TODAY	Record these • Approve these • Decisions required	Prioritised and time-estimated.
THIS WEEK	Recording queue • scheduled content • production status	Shows the operating rhythm.
PERFORMANCE	Posts • views • retention • engagement • inquiries • calls	Simple commercial signal, not data overload.
OPERATING METRICS	Founder hours • hours saved • cycle time • approval time	Makes the premium economics tangible.
LATEST INSIGHTS	Patterns, winners, bottlenecks and recommended next test	Turns analytics into decisions.

DEMO EXPERIENCE GOOD MORNING, ALEX. 3 things need you today. Record 4 scripts (~36 min). Approve 6 assets (~8 min). Decide 1 strategy recommendation. This week: 17 assets in production, 12 scheduled, 8 live. Estimated founder time saved: 9.4 hours.

7. Premium onboarding flow

The onboarding should feel like a consultant installing a system, not a cheap SaaS signup. Borrow proven onboarding UX principles from premium modern software without copying branding or exact layouts.

Onboarding UX principles

- One clear decision per screen.
- Progressive disclosure rather than one giant form.
- Visible progress and autosave.
- Explain why important data is requested.
- Conditional questions and intelligent defaults.
- Go back without losing data.
- Mark optional questions clearly.
- Review/confirmation before completion.
- Immediate transition into a populated product.

Step	Screen	Outcome
01	Welcome	What will happen + estimated time.
02	Business	Company, website, industry, geography.
03	Offer	What they sell, price, mechanism, CTA and proof.
04	Customer	ICP, pains, desires, objections and triggers.
05	Founder	Background, expertise, stories, beliefs and POV.
06	Voice	Tone, examples, vocabulary, phrases and banned wording.
07	Existing Content	Best/worst performers and inspiration examples.
08	Market	Competitors, accounts watched, customer questions.
09	Current Content Operation	Who researches/scripts/records/edits/approves/publishes/analyses + hours, people, spend, output, turnaround.
10	Goals	Desired output, platforms, business objective and cadence.
11	Commercial Path	How attention becomes inquiry,

		lead, call or purchase.
12	Integrations / Access	Only supported connections; clearly mark manual workflows.
13	Review	Summarise what Threadline learned; allow editing.
14	System Build	“Building your Brand Brain”, “Mapping your market”, “Preparing content opportunities”, “Configuring workflow”.
15	First Command Centre	Open directly into a populated dashboard and initial queue.
ONBOARDING RULE The user should feel that onboarding BUILT something. Data must immediately affect Brand Brain, research, ideas, scripts, recommended tasks and dashboard content.		

8. Creation engines - exact behaviour

Idea Engine

- Fields: concept, audience, pain/desire, pillar, platform, format, angle, hook concept, objective, CTA, source evidence, market signal, commercial intent, novelty, relevance, proof strength, format fit and priority.
- Statuses: backlog, shortlisted, approved, scripted, rejected, archived.
- Actions: manual add, AI generate, regenerate variants, bulk actions, filter/search/sort and rationale storage.

Script Engine

- Types: short-form, YouTube, LinkedIn video, educational, founder POV, story, authority, case study, objection handling, list, teardown and optional VSL/ad variants.
- Outputs: hook + 2-5 alternates, body, CTA, filming notes, estimated duration, source/context used and factual claims requiring verification.
- Controls: More like me, More direct, Less hype, Shorter, More specific, Add proof, Change angle, Rewrite hook, Generate 5 hooks.
- States: AI DRAFT, NEEDS FACT CHECK, READY TO RECORD, APPROVED.
- Maintain version history and never imply AI factual claims are automatically safe.

Recording Room

- Views: TODAY, THIS WEEK, BACKLOG.
- Show hook, title, duration, script, teleprompter, filming instructions, CTA, platform, priority and status.
- Teleprompter: full screen, scroll speed, font size, paragraph highlighting, previous/next, completion.
- Show batch estimate, e.g. “6 pieces • 47 min”.
- Attach/upload raw recording to the content item.

9. Production, packaging and distribution

Production Board

- Kanban/table hybrid with RAW → EDITING → IN REVIEW → CHANGES REQUESTED → APPROVED → SCHEDULED → LIVE.
- Cards show asset, founder, platform, editor, due date, revision count, priority, links/files and comments.
- Structured approve / request-changes flow rather than endless chat.
- Track asset history and timestamps where practical.

Packaging Engine

- Titles, captions, descriptions, thumbnail concepts, overlays, hashtags where useful, CTA options, clip opportunities and repurposing instructions.
- Support YouTube, Shorts, LinkedIn, Instagram Reels, TikTok and X with platform-specific outputs.

Distribution Queue

- Calendar + list views.
- Track piece, platform, account, publish date, state, published URL and package.
- States: draft, ready, scheduled, published, failed.
- Use integration adapters; never fake a working external connection.

10. Performance, pipeline and reporting

Performance Loop

- Store views, impressions, reach, likes, comments, shares, saves, watch time, average view duration, retention, CTR, leads, booked calls and attributed revenue where legitimately available.
- Analyse top performers and underperformers by format, topic, hook, CTA and platform.
- Generate WINNERS, LOSERS, LEARNINGS and NEXT TESTS.
- Feed learnings back into Signal Engine and Idea Engine.

Pipeline Layer

- Track CTA, lead magnet, link, source content, inbound inquiry, qualified lead, booked call, sale and attributed value.
- Goal: answer “What content appears to create qualified conversations?”
- Keep it lightweight; do not become a full CRM.

Weekly Reporting Engine

- Executive summary
- Shipped: output and platforms
- Wins: strongest assets/themes/commercial signals
- Misses: weak assets and bottlenecks
- Learnings: audience response and hypotheses
- Next week: tests, priorities, recording plan
- Client actions required
- Operating metrics: founder hours, hours saved, cycle time, approval time and output

11. Admin, tasks, library and lifecycle

Admin portal

- Clients table: workspace, status, package, onboarding stage, fees/MRR fields, last activity and alerts.
- Create client from MASTER TEMPLATE and configure branding, offer, cadence, integrations, permissions and enabled modules.
- Cross-client operator view for overdue approvals, blocked production, missing recordings, upcoming reports and system errors.
- Support/issue log with severity, owner, resolution and whether the issue should become an SOP/product fix.

Client task system

- Simple to-do layer, not generic project-management bloat.
- Only show client actions that genuinely require them: record, approve, upload proof, confirm offer changes, review recommendation.

Library

- Raw media, edited media, scripts, transcripts, research, testimonials, case studies, brand assets, offer docs, thumbnails and reports.
- Searchable and linked to content records.

12. Marketing website and application funnel

HERO Your content operation, without the content chaos.

Supporting line: Threadline installs the operating system behind founder-led content - research, ideas, scripts, production, distribution and learning in one place.

Primary CTA: Apply for Threadline • Secondary CTA: See how it works

Website sections

1. Hero
2. Problem: content fragmented across docs, Slack, Drive, editors, writers, founder voice notes, spreadsheets and analytics.
3. New operating model: YOU = record, approve, provide expertise. THREADLINE = research, plan, script, coordinate, package, organise, measure, learn.
4. Product / engine walkthrough
5. Cost / leverage: founder time, coordination, contractor overhead, throughput and speed - without unsupported savings claims.
6. How it works: DIAGNOSE → INSTALL → RUN → IMPROVE.
7. Who it is for
8. Founder/company positioning
9. FAQ
10. Application CTA

Application form

- Name, email, company, website
- What do you sell?
- Approximate monthly revenue range
- How is content currently made?

- How many people touch content?
- How often do you publish?
- Biggest bottleneck
- Founder hours/week spent on content
- Which platforms matter?
- What would a successful content operation look like?
- Are you looking to solve this now?
- Optional additional context

13. ROI / operating cost calculator

This is a sales asset and a client-baselining tool, not a promise engine.

Area	Specification
Inputs	Founder hourly value; founder hours/week on content; staff/contractor costs; pieces/month; content cycle time; optional pipeline inputs.
Outputs	Current estimated annual operating cost; founder time cost; approximate cost per shipped asset; potential capacity released under a target workflow.
Language	Use “estimated”, “scenario” and “potential capacity released”. Never imply guaranteed savings.

14. AI and integration architecture

AI abstraction

- Create a clean provider service layer. Do not scatter Anthropic/OpenAI-specific code across UI components.
- Reusable context composition: CLIENT_CONTEXT, FOUNDER_VOICE, OFFER_CONTEXT, ICP_CONTEXT, MARKET_CONTEXT, PERFORMANCE_CONTEXT, CONTENT_HISTORY and TASK_CONTEXT.
- AI output must be editable, versionable where relevant, and never treated as infallible.
- If API keys are absent, provide an explicit demo/mock provider rather than broken buttons.

Integration architecture

- Use adapters/interfaces for YouTube, Meta/Instagram, TikTok, LinkedIn, X, Drive, Dropbox, Stripe, Calendly, HubSpot, GoHighLevel, email and analytics providers.
- Do not fake integrations. If credentials or APIs are unavailable, build configuration UI + adapter + honest manual fallback.

15. Technology, tenancy and security

Claude should inspect the existing repository first. If starting from scratch, prefer a modern TypeScript stack (e.g. Next.js App Router, TypeScript, Tailwind, accessible component primitives, PostgreSQL and Supabase/equivalent where appropriate). Choose dependencies conservatively.

Security non-negotiables

- Client A can never access Client B data.

- Enforce tenant and role checks server-side, not only by hiding UI.
- Protect routes, reads, mutations, files and admin actions.
- Never expose secrets to the frontend.
- Provide .env.example; never commit credentials.
- Use validation, safe defaults, error handling, sanitisation and rate limits where appropriate.
- Use proper database migrations and seed logic.

16. Demo workspace and sales demo mode

Seed one fictional, high-quality client rather than lorem ipsum.

Field	Demo value
Founder	Alex Morgan
Business	High-ticket B2B SaaS sales-operations consultancy
Offer	£8,000 consulting engagement
Audience	B2B SaaS founders doing £500k-£5m/year
Seed content	Brand Brain, research, 30 ideas, scripts, recording queue, multiple production states, scheduled/live posts, analytics, pipeline signals, weekly report, tasks and notifications

Dedicated Demo Mode

- Screen-share-safe tour: Founder Dashboard → Brand Brain → Intelligence → Ideas → Script → Recording Room → Production → Performance → Weekly Report.
- A discreet “Demo tour” control; no ugly admin screens in the sales path.
- The demo must be impressive but believable. Never fabricate testimonials, clients, revenue or case studies.

17. Internal SOP / knowledge area

Create editable internal templates for the entire operating model.

- Lead qualification SOP
- Discovery call SOP
- Proposal / work-order SOP
- Payment SOP
- Onboarding SOP
- Access-request checklist
- Brand Brain interview script
- Initial research SOP
- Script QA rubric
- Production QA rubric
- Weekly client cadence
- Client communication template
- Monthly review
- Support / bug escalation
- Scope change

- Renewal
- Offboarding

OPERATING PRINCIPLE Every repeated action becomes software, an SOP, a template or a checklist. Every client request does NOT automatically become a feature.

18. Claude Code execution process

Before coding

- Create /docs/PRODUCT_SPEC.md
- Create /docs/ARCHITECTURE.md
- Create /docs/DATA_MODEL.md
- Create /docs/BUILD_CHECKLIST.md
- Create /docs/ACCEPTANCE_TESTS.md

Then execute sequentially

Sprint block	Definition of done
0 • Master spec	Pages, data model, roles, modules, configuration, integrations, design system, acceptance criteria and demo seed.
1 • Foundation	Auth, schema, tenant separation, roles, navigation, reusable UI, logging/errors.
2 • Context	Brand Brain, offer/ICP/proof, voice profile, examples and research sources.
3 • Creation	Market Radar, Signals, Ideas, scoring, Scripts, hook variants, teleprompter and recording queue.
4 • Workflow	Uploads, production board, editor handoff, revisions, approvals, packaging and distribution.
5 • Measurement	Analytics, winner tagging, reports, dashboard, time/output metrics.
6 • Commercial	CTA/lead fields, booked-call signals, attribution and ROI/time calculator.
7 • Admin	Client template duplication, integrations, lifecycle, export/offboarding and issue log.
8 • Demo + QA	Seed Alex, run full journey, fix broken states.
9 • Freeze	Tag v1.0, create backlog and stop feature work.

19. Acceptance tests and final delivery gate

Test area	Minimum pass condition
AUTH	Unauthenticated routes protected; correct roles; wrong roles denied; tenant separation verified.
ONBOARDING	Create client; complete onboarding; context persists after reload.
IDEAS	Create manually; generate; edit; approve; send to scripting.
SCRIPT	Generate; edit; variants; approve; send to recording.
RECORDING	Queue; teleprompter; status; attachment/upload flow.
PRODUCTION	Stage transitions; assignment; comments; revisions; approval.
DISTRIBUTION	Publishing record; manual/scheduled state; mark live; attach URL.
PERFORMANCE	Add/import demo metrics; calculations; winner/loser tagging.
PIPELINE	Link content to inquiry/call and reflect commercial signal.
REPORT	Weekly report generated from stored demo data.
ADMIN	Create/duplicate client; configuration persists; tenant visibility correct.
RESPONSIVE	Major screens at desktop, tablet and mobile widths.

Final delivery gate

- ☐ production build passes
- ☐ typecheck passes
- ☐ lint passes
- ☐ migrations valid
- ☐ demo seeds correctly
- ☐ core client journey works
- ☐ tenant isolation verified
- ☐ admin works
- ☐ onboarding works
- ☐ end-to-end content flow works
- ☐ marketing site works
- ☐ application form works

- [] responsive layouts checked
- [] loading/error/empty states checked
- [] README complete
- [] HANDOFF.md complete
- [] FUTURE_BACKLOG.md complete
- [] .env.example complete
- [] architecture docs match actual implementation

20. Mandatory HANDOFF.md

HANDOFF GOAL A brand-new Claude Code session should be able to continue the project after being told only: “Read HANDOFF.md and continue.”

1. Product overview: what Threadline is, target client, core promise and philosophy.
2. Current state: complete, partial, mocked/manual and not built.
3. Architecture: stack, directories, components, services, AI, auth, tenancy and storage.
4. Database: models, relationships, tenant keys and migrations.
5. Auth/roles and permission model.
6. Environment variables: name, purpose, required/optional, where obtained - no secret values.
7. Exact local run commands.
8. Deployment steps.
9. Demo access: seed organisation, users, demo mode and seed logic.
10. Feature map: status, route, files, dependencies and limitations.
11. Integrations: implemented / adapter / manual fallback / credentials / next step.
12. AI: provider abstraction, prompts, context composition and fallback behaviour.
13. Important product and architecture decisions with WHY.
14. Testing: commands, coverage, acceptance results and manual checks.
15. Known issues with severity.
16. Future backlog and top priorities.
17. “DO NOT BREAK” invariants: tenant isolation, data ownership, workflow integrity, AI abstraction, one codebase, no client forks.
18. Next 10 recommended tasks ranked by priority.
19. Changelog for the implementation session.
20. Last verified state: lint, typecheck, tests, production build, timestamp and commit hash if available.

During development, keep /docs/BUILD_CHECKLIST.md and /HANDOFF.md updated on disk. Use [] not started, [~] in progress, [x] complete and [!] blocked. This prevents context-window loss from destroying project state.

21. Future backlog - explicitly non-blocking

- Deep social API integrations
- Fully automated competitor ingestion
- Direct posting to every platform
- AI avatar generation
- Automated video editing
- Advanced attribution
- Native mobile app
- Payments/subscriptions
- White-labelling
- Sophisticated multi-touch attribution
- Agency reseller mode
- Autonomous research crawling

- Advanced semantic search
- Browser extension

RULE Build adapters/interfaces where useful, but none of these items is allowed to block v1 shipping.

22. Things Claude must NOT do

- Build a generic ChatGPT clone.
- Make chat the primary navigation.
- Create dozens of disconnected mini-tools.
- Create fake integrations.
- Fabricate business results, testimonials, client logos or case studies.
- Create non-functional buttons.
- Use lorem ipsum.
- Make every card a gradient.
- Use emoji everywhere.
- Create meaningless vanity charts.
- Mix client data.
- Ship obvious type/build errors.
- Leave core workflows broken.
- Stop after the homepage or dashboard scaffold.
- Respond that “the rest can be implemented later” for core v1 functionality.

23. Autonomy clause for Claude

Claude has authority to make sensible implementation decisions required to complete the product. If two approaches are reasonable, choose the cleaner and more maintainable one. If a dependency is unnecessary, do not add it. If an integration cannot genuinely function without credentials, build the correct adapter/config/manual fallback rather than faking it. If a requirement would materially harm security or maintainability, implement the technically sound interpretation and document the decision.

NO SCOPE SHRINK Do not simplify the specified product merely because the scope is large. Improve architecture and UX if useful, but do not silently remove major modules. If something cannot be genuinely implemented, implement the underlying architecture, provide a legitimate manual/demo fallback, document what remains, and continue building everything else.

24. Copy-ready Claude Code opening block

Paste the following at the very top of the build request. The rest of this document is the requirements source of truth.

You are acting as my founding CTO, senior product designer, staff full-stack engineer, systems architect and QA lead.

Your job is NOT to make me a prototype, wireframe, static mockup or superficial dashboard. Build a polished, production-quality v1 of THREADLINE in this repository.

First inspect the repository, dependencies, environment and existing code. Preserve good work. Then create the product specification, architecture, data model, build checklist and acceptance tests on disk. Execute them systematically until the full application is functional.

Do not stop after scaffolding. Do not silently remove major modules because the scope is large. Do not leave core flows as TODOs. Do not ask unnecessary minor questions when a sensible product decision can be made autonomously.

Treat this specification as the requirements source of truth. Build the complete coherent v1, seed a realistic demo client, run lint/typecheck/tests/production build, fix failures, create README + FUTURE_BACKLOG.md + mandatory HANDOFF.md, and only then declare completion.

At the end of the sprint, freeze v1 feature scope. Bugs, security issues and sales-critical gaps only. Everything else goes to the backlog.

THREADLINE v1.0 - definition of success

NORTH STAR Build once. Configure repeatedly. Sell the outcome. Prove the economics. Turn every repeated action into software, an SOP or a template.

The product loop

**UNDERSTAND → RESEARCH → DETECT SIGNALS → IDEATE → SCRIPT → RECORD →
PRODUCE → APPROVE → DISTRIBUTE → MEASURE → LEARN → REPEAT**

The founder remains responsible for

- Expertise
- Judgment
- Face
- Voice
- Recording
- Approval
- Sales

Threadline should increasingly remove everything surrounding those actions.

FINAL QUALITY BAR The finished product should make a serious founder think: “Someone has thought through my entire content operation.” Not: “Someone vibe-coded a dashboard.”

Post-P0 Operating System

This section supersedes earlier conflicting build-status, next-step and resource wording. V6 strategy remains the commercial foundation; V7 reflects what Claude has now actually built and what the course audit changed.

P0 is complete. Threadline is no longer constrained by missing core product modules. The next constraint is market validation and real delivery pressure.

Area	Current state
Core OS	47 models / 47 routes; multi-tenant, auth, workflow, lineage and files complete
Intelligence	Runs, real source collection paths, evidence provenance, citation gate, candidate human approval, ranked tests, frozen brief
Diagnosis	9 lenses, primary constraint, activation gate, monthly append-only review
Day-7 Win	Derived milestones, blocker handling, strategy sign-off
Proof	Baseline vs months, observable metrics recomputed, non-causal wording
Public site	Outcome-first hierarchy, product proof, sticky CTA, application flow
Verification	188 tests / 38 suites, strict typecheck, lint and production build pass

What Claude changed - and what it did not

The attached HANDOFF is now the source of truth for build state. It confirms the P0 upgrade was implemented without relaxing the original security, tenancy, workflow, proof or honesty invariants.

- Intelligence is now a first-class cycle rather than a mock dashboard: declared sources, honest collection, deduplicated evidence, AI-proposed candidates that must cite evidence, human approve/reject/edit, ranked tests and feedback into signal confidence.
- Constraint Diagnosis is implemented with nine dimensions, one named primary constraint, an activation gate and monthly review. The product explicitly says that more content can worsen several constraints.
- Installation / Day-7 Win derives progress from workspace facts. It deliberately avoids a user-controlled "mark done" flag.
- Proof Capture separates baseline/month periods, client-reported figures and platform-observed figures, and its language is tested not to imply causation.
- The public site was rewritten around outcome -> pain -> mechanism -> division of labour -> intelligence proof -> first win -> fit -> product proof -> CTA.

Important: Claude's technical "next 10" is useful engineering backlog, but it is not the business priority order. Email, OAuth, metric import and background jobs are not automatically more important than selling client #1.

Constraint Diagnosis v2: hypothesis, not oracle

Claude independently flagged the same risk the course audit exposed: nine ratings can look like measurement when they are actually structured judgement. Keep the lenses; change how operators reason and communicate.

The diagnosis should begin with business maturity and observable symptoms before assigning a primary constraint. A problem can be real only for a specific maturity stage; a late-stage founder bottleneck is not the same problem as an early-stage business that has not found a viable offer.

Diagnosis object	Required content
Maturity	What must already be true for this problem to exist; prior milestones; what comes next
Symptoms	Observable content, commercial, founder-time, workflow and conversion manifestations
Primary constraint	One named current constraint; severity and confidence
Evidence	Supporting evidence, contrary evidence and source provenance
Alternatives	Other plausible explanations that could produce the same symptoms
Consequence	Commercial/founder cost of leaving it unchanged
Experiment	Action, success metric, read window, falsification condition and review date

Do not remove the nine dimensions from the product. Use them as lenses. Do remove false precision from how operators and clients interpret them.

Intelligence v2: evidence becomes strategy only through a gate

The course audit strongly validates the architecture Claude has now implemented: broad collection is useful only if evidence provenance, critical review and a human decision gate survive all the way into strategy.

Stage	Threadline rule
1. COLLECT	Internal records + person-supplied URLs + pasted material. No fake platform access.
2. PRESERVE	URL/source type/time/context; deduplicate without destroying provenance.
3. EXTRACT	Customer language, pains, desires, objections, themes, outliers, hooks, offer shifts, gaps.
4. QUESTION	What is the claim? What supports it? What incentive/bias exists? What alternative interpretation fits?
5. PROPOSE	Candidate signal + citations + rationale + confidence + segment/maturity context.
6. DECIDE	Human approve/reject/edit. An unresolved citation drops the candidate.
7. TEST	Approved signal -> ranked content test -> idea -> script -> media.
8. LEARN	Performance and commercial response update signal confidence and the next cycle.

The real operational constraint: delivery load

The OS can coordinate work, but software does not make sourcing, judgement, client chasing, QA and editing disappear. Capacity must be measured from real cycles.

For every client cycle, log each task, actual minutes, owner, human/machine classification, required input, client dependency and failure point. Then ask in order: can it be deleted? automated safely? delegated? Only after that should Threadline hire around it.

Phase	Likely human judgement	Likely leverage
Research	Source selection, evidence quality, candidate decisions	Collection, dedupe, extraction
Strategy	Constraint, message and test selection	Context synthesis, candidate generation
Creation	Script/claim/voice QA	Drafting, variants, packaging
Production	Creative QA and edge cases	Editor + workflow coordination
Distribution	Exceptions/platform reality	Scheduling/manual checklists
Learning	Interpretation and commercial context	Metric aggregation, pattern suggestions

Do not sell the eleventh seat until the Delivery Load Ledger proves what ten seats actually require.

Sales-call notes become Commercial Signals

The most valuable information often lives after the content is published: real prospects explaining what they want, object to, misunderstand and buy. This input cannot depend on a client remembering a month later.

Make Commercial Signal Capture a standing habit immediately after meaningful sales conversations. Store exact customer language, trigger, desired outcome, objections, competitor/alternative, proof referenced, why they bought/did not buy, and any content they named. Promote repeated patterns into Intelligence; keep single anecdotes labelled as anecdotes.

Input	Use
Exact objection language	Scripts, positioning, objection vault, future content
Why now / trigger	Audience timing and content angles
Why bought / did not buy	Offer and proof diagnosis
Competitor/alternative	Market/positioning intelligence
Buyer-named content	Careful attribution signal
Repeated question	Answer vault + educational content

Minimum viable methodology: delete before adding

A repeated lesson from the course audit is more important now that Threadline has a powerful OS: breadth is not automatically value. The methodology should contain only actions required to solve the current problem.

- Start with all evidence/actions that might matter.
- Promote only must-have actions.
- Put them into a clear sequence.
- Remove actions whose absence does not materially reduce the result.
- Use inversion: what would make this problem worse? Remove or reverse those conditions.
- Use a leverage check: which small causes create disproportionate pain/value?
- Prefer the simplest adequate explanation/process, while keeping uncertainty explicit.

This is the control against turning Threadline into content + email + funnels + ads + CRM + setters + 97 dashboards before the first client needs them.

Draft resource architecture

The zip accompanying this blueprint now contains original Threadline working resources. They are intentionally unbranded and should be edited after live use rather than cosmetically finalised now.

Resource	Purpose
Constraint Diagnosis Workbook	Evidence-backed primary-constraint reasoning
Onboarding + Brand Brain Intake	Capture business/customer/voice/commercial context
Day-7 Win Plan	Fast first proof of understanding + execution
Monthly Strategy Report	Action -> Results -> Problems -> Future
Sales Discovery + Diagnosis	Diagnose before demo
Qualification Scorecard	Prioritise high-LTV, high-fit prospects
Answer / Objection Vault	Reusable truthful answers + market feedback
Offer + SOW checklist	Lock commercial scope and dependencies
Intelligence Evidence Protocol	Provenance -> signal -> human gate -> test
Commercial Signal Capture	Turn sales conversations into market learning
Delivery Load Ledger	Measure true hours/capacity
Proof Capture Log	Baseline and careful commercial attribution
Methodology Experiment Log	Change process scientifically
Weekly Cadence + Editor QA	Run delivery consistently
Editor/Operator Scorecards + SOP Standard	Scale only proven workflows

Updated priority order: revenue before integrations

The post-P0 business sequence now matters more than the engineering backlog.

#	Action
1	Browser QA + shared demo password
2	Choose deployment topology + deploy
3	Editor bench
4	Lock founding offer / exclusions / risk reversal
5	3-5 minute closed-loop demo
6	One-page offer, diagnosis script, proposal/SOW
7	First 100 high-LTV prospects
8	Targeted outbound + Threadline own content
9	Close client #1
10	Day-7 Win + baseline + delivery-load measurement
11	Document proof/case study
12	Only then revise methodology/product from evidence

Technical items such as email delivery, password reset, LinkedIn OAuth, automatic metric import, scheduled intelligence and advanced attribution remain legitimate backlog. They should move forward when deployment or client reality makes them the bottleneck, not because they make the product look more complete.

What remains genuinely unknown

The build is unusually complete for this stage. That makes the remaining unknowns more commercial, behavioural and operational - exactly the things a demo tenant cannot prove.

- Which initial sub-niche responds fastest and pays/retains best.
- Whether the founding price is too low, right, or too high.
- Whether 12-16 core assets is the right cadence for the first ICP.
- How many founder and operator hours a real client consumes.
- How reliably clients provide sales-call/commercial feedback.
- Which market sources remain consistently accessible and high-signal.
- What latency exists between content tests and qualified commercial response.
- Which diagnosis dimensions actually recur as primary constraints.
- How much of the current product clients use versus ignore.

The first real client cycle will answer more of these questions than another 30 software routes.

Course audit status and remaining source material

The final named written gaps from the audit have now been closed. The remaining source material is primarily video-only media whose lesson content is not present in the archived text.

Status	Material
Read / incorporated	Unique substantive written curriculum, worksheets and final named gaps including Defining Problem, Inversion, Pareto, Occam, Problem/Solution Validation, Elucidatory recap and Acquisition Systems Theory
Video-only	10 dated Q&A/livestream archive pages with embedded recordings but no transcript/notes
Video tutorial	Tech/tool walkthrough pages that expose agenda/resource links but not the spoken lesson
Pointer only	PDFs/pages that only link to another recording/download
Not counted as read	Raw video content unless separately transcribed or reviewed

This distinction is deliberate: titles, player duration and wrappers are metadata, not lesson content.

V7 decision rules

Use these to stop the project from drifting back into speculative building.

- Sell the expensive problem/outcome; reveal software as mechanism and proof.
- Diagnose before prescribing more content.
- Evidence before signal; human decision before strategy.
- One core codebase; configuration changes, client forks do not.
- No fake integrations, fake proof, causal overclaims or guaranteed reach/leads/revenue.
- Delete before adding. Automate after understanding. Delegate after proving.
- Measure operator load before claiming scale.
- Change methodology from repeated evidence, not mood.
- Client #1 is now more valuable than another theoretical strategy document.

NEXT STATE: QA -> deploy -> sell -> deliver -> measure -> iterate.

Acquisition, Recording, YouTube, Client Experience + Integrations

V8 does not replace the V7 commercial/operating strategy. It closes the areas that were reviewed but under-specified as executable systems.

Correction: the source audit was deep, but the V7 zip did not operationalise every area at the same depth. Acquisition was under-specified. V8 makes that gap inspectable and fixes it.

Area	V8 decision
Acquisition	First-class 90-day OS: ICP gate, channels, CRM, stimuli, daily floor, scoreboard, call-learning loop.
Recording	One-time Recording Readiness Install included in implementation; client gear remains client cost.
YouTube	Strategic long-form channel; custom/pilot at launch rather than silently expanding the base retainer.
Portal	One codebase, two experiences: curated client view + full operator/admin view.
Integrations	Official OAuth/API paths; manual fallback until platform approval and client demand earn automation.

Recording quality is an upstream variable

The service should not own the client's camera shopping forever, but a bad recording setup creates unnecessary editing cost and caps perceived quality.

- At onboarding, request two room photos plus a 30-60 second test clip.
- Fix the weakest upstream inputs: audio, light, stability, background and reproducibility.
- A modern phone can pass. Camera purchase is optional, not an eligibility condition.
- Source purchase logic: lighting first, then background/mic, then dedicated camera, then optional teleprompter.
- For UK indoor talking-head content, 25 fps / roughly 1/50 shutter is a strong starting profile when it suits the camera/light setup.
- Short-form deserves native vertical framing; YouTube long-form deserves native horizontal framing.

Client-facing outcome: "You should be able to sit down and record premium-looking content in under ten minutes without needing a production crew."

YouTube is not just another distribution checkbox

Charlie's inbound architecture treats YouTube as a full system: ideation, creation, storage, packaging and distribution. Current YouTube guidance likewise makes packaging and audience response first-class.

Layer	Threadline YouTube rule
Idea	Start from a commercially relevant buyer problem/evidence, not a generic posting calendar.
Package	Title + thumbnail concept before filming.
Create	Structured outline; scripted opening/CTA; strong recording standard.
Edit	Clarity and retention before effects density.
Measure	Appeal -> engagement -> satisfaction + Threadline commercial signals.
Repurpose	Only extract clips that work independently; use platform-native packaging.

Founding scope: Shorts may be normal distribution. Full long-form is a pilot/add-on or replaces defined short-form capacity until the Delivery Load Ledger proves the economics.

Client portal: transparency without exposing the kitchen

The client should not use the same information density as the operator. But a black box also weakens perceived value and creates status-chasing.

Show client	Keep internal
This week / what needs you	Raw/rejected research queue
Approvals + recording queue	AI prompts/token costs
Content status + calendar	Editor/vendor costs and staffing notes
Approved Intelligence / constraint	Unapproved diagnosis drafts
Results + commercial signals	Internal QA/debug notes
Published reports / evidence	Profitability/time tracking
"Threadline is working on..." summary	Every micro-task and failed fetch

Architecture: one database and one codebase. Separate the experience with roles, permissions, navigation and published projections - not a second portal application.

Integration reality: approvals, OAuth and quotas

The word "integration" hides several different obligations. Threadline should never imply that a platform is connected until the actual OAuth/API path works.

Platform	Production reality
YouTube	Google Cloud + OAuth. API uploads from unverified projects are private until compliance audit.
LinkedIn	Developer app + Community Management access. Development -> Standard production tier; vetted application.
Instagram	Professional accounts + Meta app/OAuth + content-publish permission; customer-account access requires appropriate review/access.
TikTok	Developer app + Content Posting API + video.publish approval; unaudited clients publish privately.
X	OAuth/Posts API; current API is pay-per-use.

- Encrypted per-tenant token storage comes before live OAuth.
- Manual publish remains a supported fallback, not an embarrassing temporary hack.
- Choose the first direct integration based on client mix; LinkedIn is likely strategically important but also an approval long pole.
- Do not create browser automation to dodge official platform review.

Threadline Acquisition OS v1

Acquisition now has an explicit control loop rather than a generic "do outbound" instruction.

Component	Threadline v1
Scheduler	Low-friction diagnosis-call booking + reminders
Platform	Primary: LinkedIn + email; secondary selective phone; tertiary referrals/warm
Stimuli	Observation-led first touch + useful warm follow-up + A-fit Loom audit
CRM	Account/contact/evidence/status/objections/next action
Lead source	LinkedIn + directories + adjacent audiences + warm network
Metric tracker	Daily first touches/follow-ups/replies/calls/offers/wins/cash/hours
Delivery mechanism	Manual/personal at launch; automation only after message/ICP proof

Daily normal target: 15 new qualified first touches + 20-30 follow-ups. Anti-stage-fright floor: 10 new qualified first touches on any acquisition workday.

90-day acquisition rhythm

The target is not maximum message volume. It is enough high-quality learning cycles to find and close two retained clients without destroying delivery quality.

Window	Primary objective
Days 1-7	Booking/CRM/sequences live, 100 seed prospects, first 25-50 touches, demo rehearsed.
Days 8-30	250-350 cumulative qualified touches; meaningful buyer conversations; first paying client targeted.
Days 31-60	Double down on best segment/channel; use real objections/proof; aim 2-3 active clients.
Days 61-90	Referrals/case evidence compound; maintain outbound; stabilize $\geq$ GBP 5k retained MRR.

- Friday review diagnoses the first broken conversion stage.
- Do not change the whole offer because one call felt bad.
- Every sales call updates the Answer Vault, ICP language and content ideas.
- If closes outpace fulfilment quality, acquisition volume stops until delivery is repaired.

V8 next state

The company does not need another conceptual rebuild. It needs launch proof.

Priority	Action
1	Browser/client-role QA
2	Deploy + secure demo credentials
3	Editor bench
4	Lock offer/legal docs
5	Seed first 100 prospects
6	Begin daily acquisition floor
7	First sales calls -> learning log
8	Close client #1
9	Recording Readiness + Day-7 delivery
10	Measure load, proof and commercial response

NEXT STATE: QA -> DEPLOY -> EXTERNAL REPS -> CLIENT #1 -> MEASURE -> ITERATE.

THREADLINE V9

Verification, Recording, YouTube, Client Experience & Integration Architecture

DRAFT - BRANDING PENDING | 03 September 2026

Why V9 exists

V9 separates source review from actual operationalisation. The course review was materially deeper than a skim, but acquisition exposed a real documentation flaw: a source area could be deeply reviewed without having an equally deep Threadline operating system. From V9 onward, every area is tracked as REVIEWED, ADAPTED, BUILT and VALIDATED separately.

Locked architecture

Recording Readiness becomes part of implementation; YouTube long-form becomes an optional/pilot service layer; clients get a simplified role-based surface of the same Threadline data model; publishing starts manual/native-delegated and integrations are earned by measured demand.

1. Recording Readiness Install

Why it belongs in the offer

Raw recording quality and recording friction are upstream constraints. Threadline should help each client reach a repeatable baseline once, then leave the setup alone unless the strategy changes.

Workflow

Room photos + 30-60 second test clip -> diagnose audio/light/framing/background/repeatability -> keep/move/buy/change plan -> second test -> READY / READY WITH LIMITATION / BLOCKED.

Do not overbuy

A modern phone, tripod, one controlled/diffused light, external mic and intentional background are enough to begin. Dedicated cameras/teleprompters are upgrades only when they solve an actual constraint.

Two native profiles

Important short-form should be recorded vertically. Long-form YouTube should be recorded 16:9 horizontally. Do not force one compromised crop to serve every strategic format.

Delivery coaching

First cycles include rehearsal, multiple takes, clean pauses, market-appropriate tone and speaking to one person rather than performing at a camera.

2. YouTube Strategy

Qualification

Long-form is strongest when buyers research before purchase, the founder has real depth/proof, customer value is high, topics have shelf-life and the business can convert trust into sales conversations.

Founding scope

YouTube Shorts can be a normal channel. Full long-form is PILOT/CUSTOM; start with one video per month for a strong-fit client and measure the full delivery load before productising.

Workflow

Evidence -> idea thesis -> title/thumbnail concepts -> opening/outline -> record -> edit -> publish -> selective multi-format extraction -> analytics + commercial learning.

Current platform correction

YouTube now explicitly supports cross-format experimentation and creating linked Shorts from public long-form. Threadline therefore rejects both extremes: do not automatically chop everything, but do not forbid repurposing when a clip genuinely stands alone.

3. Client Portal Architecture

One product, two surfaces

Do not build a duplicate app. Use one tenant/data/lineage model with a client shell and operator shell, backed by server-enforced capability/visibility rules.

Client sees

What needs me now; recording queue; approvals; client-readable content status; curated intelligence; results; reports; integration status; a real computed Threadline-is-working-on activity panel.

Client does not see

Rejected research, raw noisy evidence, private QA, editor/vendor economics, internal time/margin, AI prompts/provider costs, debug logs, private health notes or tentative diagnoses.

Visibility boundary

Use explicit visibility states such as INTERNAL, CLIENT_DRAFT, CLIENT_ACTION_REQUIRED and CLIENT_PUBLISHED rather than relying on hidden menu items.

4. Platform Access and Integrations

Phase 0

Manual/native delegated access. This is a valid service state, not a product failure. Avoid password sharing.

YouTube

Use channel permissions for manual work. Direct API requires Google Cloud/OAuth and unverified API projects are private-only for uploads until compliance audit.

LinkedIn

Company Page Content Admin works for manual Page operations. Production Community Management API uses vetted Development/Standard tiers; Standard access is applied for separately.

Instagram

Official publishing is for Professional accounts and requires the relevant publish permissions/access level for customer accounts.

TikTok

Direct Post requires video.publish authorization; unaudited API clients are restricted to private posting and caps until audit.

X

Current X API is pay-per-use credits; integrate only if paying-client usage justifies it.

Aggregator option

After 3-5 clients, compare direct APIs with a publishing layer. Buffer now exposes an API/OAuth route but current third-party access has analytics limitations. Ayrshare is purpose-built for multi-customer social API use at a recurring platform cost.

5. The actual bottleneck now

Validation

Threadline is overbuilt relative to a day-two business. Product readiness is high; market validation, sales reps, proof and measured delivery capacity remain low. Those are now the highest-value activities.

V9 launch gates

Gate	Before first client?	Reason
Deploy + browser QA	YES	Must be reliable enough to demo/onboard
Founding offer/SOW/payment	YES	Buyer must be able to pay without scramble
Recording Readiness intake	YES	Protects upstream production quality
Simplified client action/approval view	YES	Client should not need operator complexity
Direct social APIs	NO	Manual fulfilment works; reviews can wait
Full YouTube long-form productisation	NO	Pilot and measure first
Second application/client database	NO	Adds sync/permission debt
Logo on every resource	NO	Branding explicitly pending

V9 stop rule

Do not add another platform, portal module or delivery service because it sounds premium. Add it only when deployment/security blocks a sale, repeated prospects ask for it, a signed client requires it, measured delivery data identifies a bottleneck, or repeated client evidence shows it improves the outcome.
