

THREADLINE — LIVING SOP ENGINE SPEC — FINAL

OBJECTIVE

Turn Threadline's SOP library into executable state-driven workflows so the operator does not have to remember which SOP applies or reread PDFs during day-to-day work.

PRINCIPLE

CRM answers: who is this person/company/deal and what happened?

Threadline Living SOP Engine answers: given the current state, what exactly happens next?

CRM DECISION

Do NOT build a full replacement CRM.

Preferred external CRM: Attio.

Simpler fallback: Pipedrive.

External CRM owns contacts, companies, email/activity history, deal history and broad pipeline.

Threadline OS owns proprietary methodology, workflow states, daily quota, SOP checklists, next-action logic, sales states, onboarding/delivery/proof workflows and operator cockpit.

RECORD MODEL — MINIMUM

Each relevant prospect/deal/client workflow record needs:

- external CRM record ID / URL;
- record type;
- current state;
- tier (A/B/etc when relevant);
- owner;
- next action;
- due date;
- state checklist items;
- completion criteria;
- next valid states;
- relevant script/template/resource links;
- notes / evidence;
- audit history;
- timestamps;
- source/channel when relevant.

INVARIANT

No active record may exist without a next action and due date.

TODAY VIEW

The operator should open one page and see:

1. required new qualified first touches today;
2. completed and remaining acquisition touches;
3. A-tier research / pre-completed-value / Loom tasks;

4. B-tier prospects ready for outreach;
5. replies requiring classification/action;
6. follow-ups due;
7. calls today;
8. incomplete pre-call prep;
9. proposal/deal follow-ups;
10. onboarding tasks;
11. active-client blockers/approvals;
12. proof tasks;
13. overdue items.

The Today view is execution-first. Avoid vanity dashboards.

V1 WORKFLOWS — BUILD NOW

A. MARKET VALIDATION

States:

CANDIDATE_WEDGE → IMMERSION → INTERVIEWS →
COMMERCIAL_RESPONSE_TEST → VALIDATED / REVISE.

Each state shows exact checklist and evidence required before transition.

B. PROSPECT QUALIFICATION

NEW_PROSPECT → QUALIFY → QUALIFIED_A / QUALIFIED_B / NOT_FIT.

Qualification includes wedge fit, ability to pay/economics, visible problem, reachability and available context.

C. A-TIER OUTREACH

QUALIFIED_A:

- ☐ website reviewed
- ☐ founder/content reviewed
- ☐ specific achievement/content found
- ☐ likely constraint hypothesis
- ☐ useful opportunity identified
- ☐ pre-completed value asset created
- ☐ Loom recorded if justified
- ☐ message sent
- ☐ next action + due date

Then CONTACTED.

D. B-TIER OUTREACH

QUALIFIED_B:

- ☐ enough real research to be specific
- ☐ outreach sent
- ☐ next action + due date

Then CONTACTED.

E. REPLY-TO-BOOKING

CONTACTED → REPLIED → classify:

INTERESTED / CURIOUS / SEND_INFO / NOT_NOW / OBJECTION / REFERRAL / NOT_FIT / BOOKED.

Each class surfaces the right response guidance and forces a next action/date.

F. PRE-CALL PREP

BOOKED → CALL_READY.

Checklist:

- [] application/conversation reviewed
- [] business model / economics reviewed
- [] current content reviewed
- [] likely primary constraint hypothesis
- [] relevant proof / OS demo prepared
- [] reminder active.

G. SALES CALL STATE MAP

CALL_READY / LIVE_CALL:

OPEN → ECONOMICS → CURRENT_STATE → DESIRED_STATE → CONSTRAINT → CONSEQUENCE → PRESCRIPTION → DEMO → COMMERCIALS → DECISION.

Allow flexible movement but visibly show current state and what information is still missing.

At end require WON / FOLLOW_UP / PROPOSAL_PROCESS / NOT_FIT / LOST plus VOC/objection notes and next action/date.

CLIENT RESULTS / ATTRIBUTION LANE — ARCHITECT NOW, DEEPER AUTOMATION AFTER CLIENT #1

The Living SOP Engine must treat proof/measurement as an operating workflow, not an end-of-month spreadsheet.

Minimum client measurement state should support:

- BASELINE_PENDING → BASELINE_READY;
- TRACKING_SETUP_PENDING → TRACKING_READY;
- ACTIVE_MEASUREMENT;
- COMMERCIAL_SIGNAL_DUE;
- PROOF_READY.

For each active client, store or link:

- baseline period and baseline metrics;
- persistent asset/content IDs and live URLs;
- platform/channel/publish date/pillar/CTA;
- tracked destination / UTM where relevant;
- native performance metrics;
- commercial-intent events: clicks, opt-ins, DMs, enquiries, booked calls;

- commercial outcomes: qualified opportunities, pipeline and closed-won value where available;
- source/evidence and attribution class;
- first-touch / last-touch when supported;
- client-reported versus measured status.

Use attribution classes: DIRECTLY_TRACKED / BUYER_NAMED_CLIENT_ATTRIBUTED / MULTI_TOUCH_INFLUENCED / ASSOCIATED_CORRELATED / QUALITATIVE_ONLY. Never let the UI imply causal revenue attribution when evidence only supports influence or correlation.

Minimum tracking stack is manual-friendly: asset ledger + trackable links/UTMs where possible + external CRM source/deal data + booking source question + weekly client Commercial Signal Capture + native analytics. An attribution provider such as Trakyo/equivalent is optional and should pass the Integration Decision Gate before being depended on.

CEO HUB RESULTS VIEW

Extend the broader Master CEO Hub architecture with a Results/Proof lane. For each client show tracking health (baseline, asset IDs/URLs, tracked-link coverage, CRM source capture, booking-source capture, last commercial-signal update), plus Operational / Attention / Commercial Intent / Commercial Outcome metrics. Once sufficient data exists, support normalized metrics such as booked calls per 10k views, qualified pipeline per 10k views and revenue per asset. Do not surface monetary efficiency when data quality is inadequate.

V2 WORKFLOWS — BUILD ONLY WHEN REAL USE EARNS THEM

WON → agreement/payment/onboarding.

PAID → Brand Brain + kickoff.

DAY7 → install milestones.

ACTIVE_CLIENT → weekly delivery.

MONTHLY_REVIEW → Action/Results/Problems/Future.

PROOF_READY → case study interview + proof repurposing.

RENEWAL → retention/renewal flow.

OFFBOARD → clean handoff and proof capture.

REVERSE-ENGINEERED ACQUISITION MODULE

Input:

- target wins;
- remaining acquisition workdays;
- booking rate;
- show rate;
- qualification rate;
- close rate.

Output:

required first touches and daily quota.

Every Friday use actual rates to recalculate.

Keep channel-level numbers separate.

If resulting quota is unreasonable, flag diagnosis rather than simply increasing volume.

STATE TRANSITION BEHAVIOUR

When all required checklist items are complete:

- enable transition to allowed next state;
- automatically create default next action + due date where deterministic;
- log timestamp/user/change;
- show any missing evidence before allowing irreversible transitions;
- do not auto-send email or publish content without explicit user action.

SOP PRESENTATION

Do not show the whole SOP document.

Show only:

- what this state means;
- why it matters;
- exact checklist;
- short scripts/examples if needed;
- completion criteria;
- next step.

Link to long-form SOP only as optional reference.

EXTERNAL CRM INTEGRATION

Phase 0: manual external CRM URL/ID is acceptable.

Phase 1: sync only after the workflow is proven and the integration clearly saves repeated work.

Never fake connectivity.

DESIGN PRINCIPLES

- operator-first;
- low cognitive load;
- one clear next action;
- no duplicated project-management bloat;
- mobile-readable Today queue;
- server-enforced permissions;
- preserve one-codebase / multi-tenant architecture;
- audit trail for state changes;
- allow manual override with reason;
- real data only.

ANTI-OVERBUILD

Do not build email client, calendar, generic contact manager, generic CRM reporting, auto-social publishing or speculative integrations.

The proprietary advantage is the encoded Threadline method, not generic CRM plumbing.

SUCCESS CRITERION

The operator can open Threadline with no memory of the SOP library and still correctly execute the next best action for every active prospect/client, because state + checklist + due date make the process obvious.
